

Cisco 809 Industrial Integrated Services Routers

Cisco[®] 809 Industrial Integrated Services Routers, referred to here as the IR809, are compact, ruggedized routers designed for deployment in harsh industrial environments.

The IR809 is Cisco's smallest multimode 3G and 4G LTE wireless router, making it an excellent solution for distribution automation and remote asset management across multiple industrial vertical markets (Figure 1). The IR809 has an integrated 9.6 to 60V DC power input and is designed to withstand hostile environments, including shock, vibration, dust, and humidity, and supports a wide temperature range (–40 to 60°C and type-tested at 85°C for 16 hours). The IR809 brings together:

- Enterprise-class wireline-like services, such as quality of service (QoS)
- Cisco advanced virtual private network (VPN) technologies (such as Dynamic Multipoint VPN [DMVPN] and Flexible VPN [FlexVPN])
- Multiple Virtual Routing and Forwarding (VRF) instances for cellular highly secure data, voice, and video communications
- Cisco IOx, an open, extensible environment for hosting applications at the network edge

The IR809 also extends connectivity to include low-power wide-area (LPWA) access using the Cisco Interface Module for LoRaWAN.

The IR809 routers offer a broad range of features for industrial and enterprise Internet of Things (IoT), as listed in Figure 2.

Figure 2. Cisco 809 Industrial Integrated Services Routers Offer a Broad Range of Features

4G LTE multiple-bearer QoS for cellular: The IR809 supports 4G LTE multiple bearers, enabling differentiated treatment of traffic based on the QoS policies. The QoS feature depends on a service provider's ability to classify and enforce QoS policies and hence requires providers to launch this service in their networks.

Multi-VRF: The IR809 supports the multi-VRF feature, which allows customers to configure and maintain more than one instance of a routing and forwarding table within the same customer edge (CE) device. For service providers, this feature enables them to support two or more VPNs, and the IP addresses can overlap several VPNs.

Business Benefits and Application Examples

Industrial customers are looking for real-time monitoring and control of industrial assets to help increase operation efficiency.

Utilities

Utilities are seeking the capability to monitor thousands of miles of electrical or water infrastructure often located in harsh environments through 3G and 4G cellular networks to provide remote assets monitoring and reliable and secure SCADA traffic backhauling. Devices that enable this connectivity need to be able to be remotely monitored and configured. They also need to support traditional serial interfaces to interconnect with existing monitoring devices.

Oil and Gas

Oil and gas companies need to monitor pipeline infrastructure across wide geographic areas and remote locations using 3G and 4G cellular networks to collect data from remote terminal units and securely transport SCADA traffic to a network operations center (NOC).

Transportation

Highways and transportation agencies require reliable always-on communication between speed cameras, monitoring cameras, ticket terminals, etc. Wireless devices to support such continuous communication need to support 3G and 4G networks to help ensure good, wide coverage; support continuous operation in very harsh environments; be very compact for deployment in roadside cabinets; and support serial interfaces to existing traditional devices.

Primary Features and Benefits

Table 1 lists the features and benefits of the IR809.

 Table 1.
 Features and Benefits of Cisco 809 Industrial Integrated Services Routers

Features	Benefits		
IoT Enablement			
Compact ruggedized form factor	Designed for hostile outdoor remote assets monitoring and machine-to-machine (M2M) communications and integrated 9.6 to 60V DC power supply.		
Raw socket transport and SCADA	Raw Socket can be used to transport SCADA data from RTUs. This method is an alternative to the Block Serial Tunnel (BSTUN) protocol. The IR809 provides DNP3 serial-to-DNP3/IP translation and IEC 60870 T101-to-IEC 60870 T104 protocol translation to serve as a SCADA gateway to do the following: Receive data from RTUs (T101 or DNP3 serial) and relay configuration commands from the contro center (T104 or DNP3 IP) SCADA applications. Receive configuration commands from the control center and relay RTU data to the control center. Terminate incoming T104 or DNP3 IP requests from the control center when an RTU is offline.		
Cisco IOx application support	Provides an open, extensible environment for hosting OS and applications at the network edge.		
loT field network director	Available as an optional Industrial Operations Kit. This software platform manages a multiservice network and security infrastructure for IoT applications such as transportation, smart grid, services, distribution automation, and substation automation.		
Multiple mounting options	Supports a variety of mounting options: floor mount, wall mount, and DIN rail mount.		
Lightweight, compact size with low power consumption	 Can be deployed in many different environments where space, heat dissipation, and low power consumption are critical factors. 		
Increased performance to run concurrent services	 Performance allows customers to take advantage of broadband network speeds while running highly secure, concurrent data, voice, video, wireless, and IoT services. 		
Enhanced security	 An integrated stateful and application inspection firewall provides network perimeter security. Hardware-assisted high-speed IP Security (IPsec), Triple Data Encryption Standard (3DES), and next-generation encryption protocols such as Advanced Encryption Standard (AES) and Secure Hash Algorithm (SHA) offer data privacy over the Internet. 		
	Intrusion prevention enforces security policies in a larger enterprise or service provider network.		
Multiple WAN and LAN Connections			
Two Gigabit Ethernet interfaces	 Allows multiple Ethernet device connectivity in a small office or other remote location with the capability to designate a port as the network edge. Provides VLANs for Layer 3 IP subinterfaces. Provides inter-VLAN routing capabilities. 		
Two serial interfaces	 These two asynchronous serial interfaces (one RS-232 port and one RS-232/RS485 port) can be used with Raw Socket, protocol translation, and IOx applications to provide two serial connections to local RTUs for SCADA transport and RTU management. 		
LoRaWAN	Extends IR809 connectivity to include LPWA access using Cisco Interface Module for LoRaWAN. For more information, see http://www.cisco.com/c/en/us/products/routers/interface-module-lorawan .		
Transparent Roaming Between Wireles	s Networks		
Dual subscriber-identity-module (SIM) support	The dual SIM feature provides reliability and multihoming capabilities over LTE and HSPA networks.		
Cisco IOS® Mobile IP features	 Mobile IP offers transparent roaming for mobile networks, establishing a transparent Internet connection regardless of location or movement. This feature enables mission-critical applications to stay connected even when roaming between networks. Assigned IP addresses to the home network are maintained in private and public networks. 		
	Both Proxy Mobile IP (PMIPv6) and Network Mobility (NEMO) are supported.		
Cisco IOS Mobile network features	This feature allows an entire subnet or mobile network to maintain connectivity to the home network while roaming.		
Multiple wireless WAN technologies	Users can use the best wireless (4G LTE, 3.7G, 3.5G, 3G, or 2G) technology or network available. IR809G-LTE-LA-K9 does not support 2G.		

Features	Benefits		
Advanced IP Services in Standards-Based Cisco IOS Software			
Advanced security features	 Authorization and authentication determine which individuals and devices have access to the network. 		
	Firewall protection provides perimeter security when public networks are used.		
	 3DES and AES encryption provide highly secure VPNs when data is transmitted and received over public networks. 		
	 The next-generation protocol suites enable users to monitor potential malicious activity on the network. 		
	IPsec over IPv4 & IPv6, IPsec stateful failover, VRF-aware IPsec, DMVPN, FlexVPN and PMIPv6.		
Routing	 Enables advanced routing capabilities using Enhanced Interior Gateway Routing Protocol (EIGRP), Multiprotocol Border Gateway Protocol (MP-BGP), IPv4 and IPv6 on all interfaces including cellular, IPv4/IPv6 Multicast, Generic Routing Encapsulation (GRE) and multipoint GRE (MGRE), Network Address Translation (NAT), Domain Name System (DNS) proxy and spoofing, IP service- level agreement (SLA), and QoS. 		
QoS features	Provides traffic precedence to delay-sensitive and mission-critical services.		
	Facilitates low-latency routing of delay-sensitive industrial applications.		
	Supported on all LAN and WAN interfaces including cellular.		
	 Provides LTE QoS with support for up to 8 concurrent bearers on each cellular WAN interface for traffic classification and prioritization. 		
Management and manageability	 Network managers can remotely manage and monitor networks with Simple Network Management Protocol Versions 1, 2, and 3 (SNMPv1, v2, and v3); Telnet; and HTTP/HTTPS and Secure Shell Version 2 (SSHv2). They can also manage and monitor networks locally through a console port. 		
	 Support for extensive 3G and 4G LTE-based MIBs allows centralized management of remote devices and gives network managers visibility into and control over the network configuration at the remote site. 		
	 Network managers can reset to a predesignated golden image, as well as configure an IR809 through Cisco IOS[®] Software or through an external reset button. 		
	 Network managers can upgrade 3G, 3.5G, 3.7G, and 4G LTE firmware and router configurations remotely. 		
	 The tight integration with Cisco IOS Software enables the router to self-monitor the LTE WAN link and automatically recover from a radio link failure. 		
	 Network management tools such as Cisco IoT Field Network Director, Cisco Prime, and APIC-EM simplify deployment of a secure network head end using the Cisco Industrial Operations Kit.
