OVERVIEW (CONTINUED)

SECURE 2- OR 4-PORT DUAL-HEAD DISPLAYPORT KVM SWITCH DATA SHEET

WHY SECURE KVM?

Traditional non-secure KVM switches offer centralized control of multiple computers, but offer no absolute isolation between them. This exposes systems to the possibility of malicious damage and disruption, and acquisition of sensitive data from one computer to another.

Black Box's Secure KVM Switch is designed for use in secure defense and intelligence applications where sensitive data must be protected. The Secure KVM Switch is Certified for NIAP Protection Profile for Peripheral Sharing Device Version 4.0 and equipped with the highest security features that meet today's Information Assurance safe control standards. The switch prevents data leakage between computers that can run at different security levels, and eliminates any potential cyber threat.

SECURE EDID LEARN AND VIDEO EMULATION

The KVS4-2004V simulates a generic EDID as default, allowing it to operate most of the connected monitors. Both selected and non-selected computers maintain a constant connection with the unit's video emulation controllers, allowing for ultra-fast switching and restricting discovery of newly connected monitors during switching operations. Upon activating the KVM, the unit will quickly and automatically learn new EDID for specific monitors. The unit then prevents unwanted and unsecure data from getting transmitted through DDC lines by means of secure EDID learning and emulation.

ULTRA-SECURE KVM SWITCHING

The KVS4-2002V or KVS4-2004V allows users to control KVM (Keyboard, Video and Mouse) operation on up to two or four computers with DisplayPort™ displays. It features mechanical, electrical and optical signal isolation to prevent hacking and data leakage in environments where security is paramount.

With the KVS4-2002V or KVS4-2004V, all data relays are controlled by inverted signals, shielding connections from outside intrusion by forcing them each to work one at a time.

Each port uses its own isolated data channel and each unit features non-reprogrammable ROM to better protect the switch's functions. Better yet, the switch offers the highest security when accessing classified and public networks over the internet through these isolated connections.

By isolating connections between networks, the KVS4-2002V or KVS4-2004V ensures no data is leaked between secure ports and the outside world.

The KVS4-2002V or KVS4-2004V has clearly marked front-panel buttons for controlling the device, so securely switching between sources is always simple. For high-grade secure switching made easy, look no further than the KVS4-2002V or KVS4-2004V.

SECURE EDID LEARN AND VIDEO EMULATION

The Secure KVM emulates (simulates) the presence of a keyboard and mouse for every attached computer through a USB cable. Both selected and non-selected computers maintain a constant connection with the unit's keyboard-mouse emulation controllers, allowing for ultra-fast switching and restricting discovery of newly connected peripherals during switching operations. Emulation of keyboard and mouse also prevents direct connection between the peripherals and the connected computers, shielding systems from potential vulnerabilities.
