Preface

Audience

This guide is for the networking professional who installs and manages the Cisco Aironet 1240AG Series Access Point. The 1240AG series access point is available in autonomous and lightweight configurations.

To use this guide with autonomous access points, you should have experience working with Cisco IOS software and be familiar with the concepts and terminology of wireless local area networks.

To use this guide with lightweight access points, you should have experience working with a Cisco Wireless LAN Controller and be familiar with the concepts and terminology of wireless local area networks.

Purpose

This guide provides the information you need to install your autonomous or lightweight access point. For detailed information about Cisco IOS commands used with autonomous access points, refer to the *Cisco IOS Command Reference for Cisco Aironet Access Points and Bridges* for this release. For information about the standard Cisco IOS Release 12.3 commands, refer to the Cisco IOS documentation set available from the Cisco.com home page at Technical Support & Documentation. On the Technical Support & Documentation home page, click Cisco IOS Software > Cisco IOS Software Releases 12.3 Mainline.

For information about Cisco Wireless LAN Controllers, refer to the Cisco documentation sets available from the Cisco.com home page at Technical Support & Documentation. On the Technical Support & Documentation home page, click Wireless and the documentation is listed under the “Wireless LAN Controllers” section.

Organization

This guide is organized into these chapters:

Chapter 1, “Overview,” lists the software and hardware features of the access point and describes the access point’s role in your network.

Chapter 2, “Installing the Access Point,” describes how to mount the access point on a desktop, wall, or ceiling, how to connect Ethernet, serial, and power cables, and provides an installation summary, safety warnings, and general guidelines.
Chapter 3, “Troubleshooting 1240AG Series Autonomous Access Points,” provides troubleshooting procedures for basic problems with the autonomous access point.

Chapter 4, “Troubleshooting 1240AG Series Lightweight Access Points,” provides troubleshooting procedures for basic problems with the lightweight access point.

Appendix A, “Translated Safety Warnings,” provides translations of the safety warnings that appear in this publication.

Appendix B, “Declarations of Conformity and Regulatory Information,” provides declarations of conformity and regulatory information for the access point.

Appendix D, “Channels and Maximum Power Levels,” lists the autonomous access point radio channels and the maximum power levels supported by the world’s regulatory domains.

Appendix E, “Console Cable Pinouts,” identifies the pinouts for the serial console cable that connects to the access point’s serial console port.

Appendix F, “Priming Lightweight Access Points Prior to Deployment,” describes the procedure to prime access points with controller information.

Appendix G, “Configuring DHCP Option 43 for Lightweight Access Points,” describes the procedure to configure DHCP Option 43 for lightweight access points.

Conventions

This publication uses these conventions to convey instructions and information:

Command descriptions use these conventions:
- Commands and keywords are in boldface text.
- Arguments for which you supply values are in italic.
- Square brackets ([ ]) mean optional elements.
- Braces ( { } ) group required choices, and vertical bars ( | ) separate the alternative elements.
- Braces and vertical bars within square brackets ( [ { | } ] ) mean a required choice within an optional element.

Interactive examples use these conventions:
- Terminal sessions and system displays are in screen font.
- Information you enter is in boldface screen font.
- Nonprinting characters, such as passwords or tabs, are in angle brackets (< >).

Notes, cautions, and timesavers use these conventions and symbols:

Tip Means the following will help you solve a problem. The tips information might not be troubleshooting or even an action, but could be useful information.

Note Means reader take note. Notes contain helpful suggestions or references to materials not contained in this manual.
Caution

Means reader be careful. In this situation, you might do something that could result equipment damage or loss of data.

Warning

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. (To see translations of the warnings that appear in this publication, refer to the appendix “Translated Safety Warnings.”)
Related Publications

These documents provide information about the autonomous access point:

- Release Notes for Cisco Aironet Access Points
- Cisco IOS Command Reference for Cisco Aironet Access Points and Bridges
- Cisco IOS Software Configuration Guide for Cisco Aironet Access Points

These documents provide information about the lightweight access point and the controller:

- Release Notes for Cisco Wireless LAN Controllers and Lightweight Access Points
- Cisco IOS Software Configuration Guide for Cisco Aironet Access Points

Click this link to browse to the Cisco Wireless documentation home page:

To browse to the 1240AG series access point documentation, click Cisco Aironet 1240AG Series listed under “Wireless LAN Access.”

To browse to the Cisco Wireless LAN Controller documentation, click Cisco 4400 Series Wireless LAN Controllers or Cisco 2000 Series Wireless LAN Controllers listed under “Wireless LAN Controllers.”
Locating the Product Serial Number

The access point serial number is on the bottom of the housing (refer to Figure 1).

The access point serial number label contains the following information:

- Model number, such as AIR-AP1242AG-A-k9 or AIR-LAP1242AG-A-k9
- Serial number, such as VDF0636XXXX (11 alphanumeric digits)
- MAC address, such as 00abc65094f3 (12 hexadecimal digits)
- Location of manufacture, such as Made in Singapore

You need your product serial number when requesting support from the Cisco Technical Assistance Center.
Obtaining Documentation, Obtaining Support, and Security Guidelines

For information on obtaining documentation, obtaining support, providing documentation feedback, security guidelines, and also recommended aliases and general Cisco documents, see the monthly What’s New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Overview

The Cisco Aironet 1240AG Series Access Point is available in autonomous and lightweight configurations. The autonomous access points can support standalone network configurations with all configuration settings maintained within the access points. The lightweight access points operate in conjunction with a Cisco wireless LAN controller with all configuration information maintained within the controller.

Product Terminology

The following terms refer to the autonomous and lightweight products:

- The term *access point* describes both autonomous and lightweight products.
- The term *autonomous access point* describes only the autonomous product.
- The term *lightweight access point* describes only the lightweight product.
- The term *access point* describes a product operating as an access point.
- The term *bridge* describes a product operating as a bridge.

Autonomous Access Points

Cisco Aironet 1240AG Series Access Point (AIR-AP1242AG or AIR-AP1242G) provides a secure, affordable, and easy-to-use wireless LAN solution that combines mobility and flexibility with the enterprise-class features required by networking professionals. With a management system based on Cisco IOS software, the 1240AG series is a Wi-Fi certified, wireless LAN transceiver.

The autonomous 1242AG access point contains two integrated radios: a 2.4-GHz radio (IEEE 802.11g) and a 5-GHz radio (IEEE 801.11a). The autonomous 1242G access point contains a single integrated radio: a 2.4-GHz radio (IEEE 802.11g).

The access point serves as the connection point between wireless and wired networks or as the center point of a stand-alone wireless network. In large installations, wireless users within radio range of an access point can roam throughout a facility while maintaining seamless, uninterrupted access to the network.

You can configure and monitor the access point using the command-line interface (CLI), the browser-based management system, or Simple Network Management Protocol (SNMP).
Lightweight Access Points

The Cisco Aironet 1240AG Series Access Point (AIR-LAP1242AG or AIR-LAP1242G) combines mobility and flexibility with the enterprise-class features required by networking professionals. These lightweight access points are part of the Cisco Integrated Wireless Network Solution and require no manual configuration before they are mounted. The lightweight access point is automatically configured by a Cisco wireless LAN controller (hereafter called a controller) using the Lightweight Access Point Protocol (LWAPP).

The lightweight 1242AG access point contains two integrated radios: a 2.4-GHz radio (IEEE 802.11g) and a 5-GHz radio (IEEE 801.11a). The lightweight 1242G access point contains a single integrated radio: a 2.4-GHz radio (IEEE 802.11g). Using a controller, you can configure the radio settings.

In the Cisco Centralized Wireless LAN architecture, access points operate in the lightweight mode (as opposed to autonomous mode). The lightweight access points associate to a controller. The controller manages the configuration, firmware, and control transactions such as 802.1x authentication. In addition, all wireless traffic is tunneled through the controller.

LWAPP is an Internet Engineering Task Force (IETF) draft protocol that defines the control messaging for setup and path authentication and run-time operations. LWAPP also defines the tunneling mechanism for data traffic.

In an LWAPP environment, a lightweight access point discovers a controller by using LWAPP discovery mechanisms and then sends it an LWAPP join request. The controller sends the lightweight access point an LWAPP join response allowing the access point to join the controller. When the access point is joined, the access point downloads its software if the versions on the access point and controller do not match.

After an access point joins a controller, you can reassign it to any controller on your network.

LWAPP secures the control communication between the lightweight access point and controller by means of a secure key distribution, utilizing X.509 certificates on both the access point and controller.

This chapter provides information on the following topics:
- Hardware Features, page 1-3
- Network Examples with Autonomous Access Points, page 1-8

Guidelines for Using Cisco Aironet Lightweight Access Points

You should keep these guidelines in mind when you use a lightweight access point:
- Lightweight access points can only communicate with Cisco 2006 series wireless LAN controllers or 4400 series controllers. Cisco 4100 series, Airespace 4012 series, and Airespace 4024 series controllers are not supported because they lack the memory required to support access points running Cisco IOS software.
- Lightweight access points do not support Wireless Domain Services (WDS) and cannot communicate with WDS devices. However, the controller provides functionality equivalent to WDS when the access point associates to it.
- Lightweight access points support eight BSSIDs per radio and a total of eight wireless LANs per access point. When a lightweight access point associates to a controller, only wireless LANs with IDs 1 through 8 are pushed to the access point.
- Lightweight access points do not support Layer 2 LWAPP. They must get an IP address and discover the controller using DHCP, DNS, or IP subnet broadcast.
The lightweight access point console port is enabled for monitoring and debug purposes (all configuration commands are disabled when the access point is associated to a controller).

## Hardware Features

Key hardware features of the access point include:

- Dual-radio operation (see page 1-5)
- Ethernet port (see page 1-5)
- Console port (see page 1-6)
- LEDs, (see page 1-6)
- Multiple power sources (see page 1-6)
- UL 2043 certification (see page 1-7)
- Anti-theft features (see page 1-7)

Refer to Appendix C, “Access Point Specifications,” for a list of access point specifications.

Figure 1-1 shows the access point with antennas.

![Access Point with Antennas](image-url)
Figure 1-2 illustrates the 2.4-GHz connector end of the access point.

3. Security key slot
Single or Dual-Radio Operation

The 1242AG access point supports simultaneous radio operation using a 2.4-GHz 802.11g radio and a 5-GHz 802.11a radio. The 1242G access point supports a single 2.4-GHz 802.11g radio. Each radio uses dual-diversity integrated antennas.

The 5-GHz radio incorporates an Unlicensed National Information Infrastructure (UNII) radio transceiver operating in the UNII 5-GHz frequency bands. The 802.11g radio is called Radio0 and the 802.11a radio is called Radio1.

Antennas Supported

Table 1-1 lists the supported access point antennas.

Ethernet Port

The auto-sensing Ethernet port (see Figure 1-2) accepts an RJ-45 connector, linking the access point to your 10BASE-T or 100BASE-T Ethernet LAN. The access point can receive power through the Ethernet cable from a power injector, switch, or power patch panel. The Ethernet MAC address is printed on the label on the back of the access point (refer to the “Locating the Product Serial Number” section on page xiii).
Console Port

The serial console port can be used to monitor the access point power-up sequences using a terminal emulator program. The port is located on the end of the unit (see Figure 1-2). Use an RJ-45 to DB-9 serial cable to connect your computer’s COM port to the access point’s serial console port. (Refer to Appendix E, “Console Cable Pinouts,” for a description of the console port pinouts.) Assign the following port settings to a terminal emulator to open the management system pages: 9600 baud, 8 data bits, No parity, 1 stop bit, and no flow control.

Note
After completing your configuration changes, you must remove the serial cable from the access point.

LEDs

The access point has three LEDs to indicate Ethernet activity, radio activity, and status indications (refer to the “Checking the Lightweight Access Point LEDs” section on page 3-2 or the “Checking the Lightweight Access Point LEDs” section on page 4-3 for additional information). Figure 1-2 shows the location of the LEDs:

- The Status LED provides general operating status and error indications.
- The Ethernet LED signals Ethernet traffic on the wired Ethernet LAN and provides Ethernet error indications.
- The Radio LED signals that wireless packets are being transmitted or received over the radio interface and provides radio error indications.

Power Sources

The access point can receive power from an external power module or from inline power using the Ethernet cable. The access point supports the IEEE 802.3af inline power standard and Cisco CDP Power Negotiation. Using inline power, you do not need to run a power cord to the access point because power is supplied over the Ethernet cable.

Warning
This product must be connected to a Power over Ethernet (PoE) IEEE 802.3af compliant power source or an IEC60950 compliant limited power source. Statement 353

Caution
Be careful when handling the access point; the bottom plate might be hot.

The access point supports the following power sources:

- Power module
- Inline power:
  - Cisco Aironet Power Injector (AIR-PWRINJ3 or AIR-PWRINJ-FIB)
  - An inline power capable switch, such as the Cisco Catalyst 3550 PWR XL, 3560-48PS, 3570-48PS, 4500 with 802.3AF PoE module, or the 6500 with 802.3AF PoE module
  - Other inline power switches supporting the IEEE 802.3af inline power standard
Note
Some switches and patch panels might not provide enough power to operate the access point with both 2.4-GHz and 5-GHz radios. At power-up, if the access point is unable to determine that the power source can supply sufficient power, the access point automatically deactivates both radios to prevent an over-current condition. The access point also activates a Status LED low power error indication and creates an error log entry (refer to the “Checking the Lightweight Access Point LEDs” section on page 3-2 and the “Checking Basic Settings” section on page 3-3).

UL 2043 Certification

The access point has adequate fire resistance and low smoke-producing characteristics suitable for operation in a building’s environmental air space, such as above suspended ceilings, in accordance with Section 300-22(c) of the NEC, and with Sections 2-128, 12-010(3) and 12-100 of the Canadian Electrical Code, Part 1, C22.1.

Caution
Only the fiber-optic power injector (AIR-PWRINJ-FIB) has been tested to UL 2043 for operation in a building’s environmental air space; the AIR-PWRINJ3 power injector and the power module are not tested to UL 2043 and should not be placed in a building’s environmental air space, such as above suspended ceilings.

Anti-Theft Features

There are three methods of securing the access point:

- Security cable keyhole—You can use the security cable slot (see Figure 1-3) to secure the access point using a standard security cable, like those used on laptop computers (refer to the “Using a Security Cable” section on page 2-17).

- Security hasp—When you mount the access point on a wall or ceiling using the mounting plate and the security hasp, you can lock the access point to the plate with a padlock (see Figure 1-4). Compatible padlocks are Master Lock models 120T and 121T or equivalent.

• Cable security bracket—The cable security bracket (see Figure 1-5) attaches to the mounting plate and covers the console port, Ethernet port, power port, and the mode button to prevent the installation or removal of the cables or the activation of the mode button. The cable security bracket is user removable prior to attaching the mounting plate to a ceiling or wall.

Network Examples with Autonomous Access Points

This section describes the autonomous access point’s role in three common wireless network configurations. The autonomous access point’s default configuration is as a root unit connected to a wired LAN or as the central unit in an all-wireless network.

The autonomous 1240AG series access point supports these operating wireless modes:

• Root access point—Connected to a wired LAN and supports wireless clients.
• Repeater access point—Not connected to a wired LAN, associates to a root access point, and supports wireless clients.
• Workgroup bridge—Not connected to a wired LAN, associates to a root access point or bridge, and supports wired network devices.
• Root bridge—Connected to a wired LAN and supports non-root bridges and wireless clients.
• Non-root bridge—Not connected to a wired LAN, associates to a root bridge, supports wireless clients, and supports wired clients.
Root Access Point on a Wired LAN

An autonomous access point connected directly to a wired LAN provides a connection point for wireless users. If more than one autonomous access point is connected to the LAN, users can roam from one area of a facility to another without losing their connection to the network. As users move out of range of one access point, they automatically connect to the network (associate) through another access point. The roaming process is seamless and transparent to the user. Figure 1-6 shows access points acting as root units on a wired LAN.

Figure 1-6  Access Points as Root Units on a Wired LAN
Repeater Unit that Extends Wireless Range

An autonomous access point can be configured as a stand-alone repeater to extend the range of your infrastructure or to overcome an obstacle that blocks radio communication. The repeater forwards traffic between wireless users and the wired LAN by sending packets to either another repeater or to an access point connected to the wired LAN. The data is sent through the route that provides the best performance for the client. Figure 1-7 shows an autonomous access point acting as a repeater. Consult the Cisco IOS Software Configuration Guide for Cisco Aironet Access Points for instructions on setting up an access point as a repeater.

Note
Non-Cisco client devices might have difficulty communicating with repeater access points.

Figure 1-7  Access Point as Repeater
Central Unit in an All-Wireless Network

In an all-wireless network, an autonomous access point acts as a stand-alone root unit. The autonomous access point is not attached to a wired LAN; it functions as a hub linking all stations together. The access point serves as the focal point for communications, increasing the communication range of wireless users. Figure 1-8 shows an autonomous access point in an all-wireless network.

Bridge Network with Wireless Clients

The access point supports root bridge and non-root bridge roles used to interconnect a remote LAN to the main LAN (see Figure 1-9). The bridge units can also support wireless clients.
Point-to-Point Bridge Configuration

In a point-to-point bridge configuration, two bridges interconnect two LAN networks using a wireless communication link (see Figure 1-10). The bridge connected to the main LAN network is classified as a root bridge and the other bridge is classified as a non-root bridge.

![Figure 1-10 Point-to-Point Bridge Configuration](image)

Workgroup Bridge Network

The access point supports a workgroup bridge role to interconnect remote Ethernet workstations to the main LAN. The workgroup bridge can communicate with an access point (see Figure 1-11) or with a bridge (see Figure 1-12).

![Figure 1-11 Workgroup Bridge Communicating with an Access Point](image)

![Figure 1-12 Workgroup Bridge Communicating with a Bridge](image)
Network Example with Lightweight Access Points

The lightweight access points support Layer 3 network operation. Lightweight access points and controllers in Layer 3 configurations use IP addresses and UDP packets, which can be routed through large networks. Layer 3 operation is scalable and recommended by Cisco.

This section illustrates a typical wireless network configuration containing lightweight access points and a Cisco Wireless LAN Controller (see Figure 1-13).

Figure 1-13  Typical Lightweight Access Point Network Configuration Example
Installing the Access Point

This chapter describes the installation of the access point and includes these sections:

- Safety Information, page 2-2
- Warnings, page 2-2
- Unpacking the Access Point, page 2-3
- Basic Installation Guidelines, page 2-4
- Controller Discovery Process for Lightweight Access Points, page 2-4
- Mounting Overview, page 2-7
- Mounting on a Horizontal or Vertical Surface, page 2-9
- Mounting Below a Suspended Ceiling, page 2-10
- Mounting Above a Suspended Ceiling, page 2-11
- Mounting Access Point on a Desktop or Shelf, page 2-14
- Cable Security Bracket, page 2-14
- Attaching the Access Point to the Mounting Plate, page 2-16
- Securing the Access Point, page 2-17
- Connecting the Ethernet and Power Cables, page 2-20
- Powering Up the Access Point, page 2-22
Safety Information

Follow the guidelines in this section to ensure proper operation and safe use of the access point.

FCC Safety Compliance Statement

The FCC with its action in ET Docket 96-8 has adopted a safety standard for human exposure to radio frequency (RF) electromagnetic energy emitted by FCC certified equipment. When used with approved Cisco Aironet antennas, Cisco Aironet products meet the uncontrolled environmental limits found in OET-65 and ANSI C95.1, 1991. Proper installation of this radio according to the instructions found in this manual will result in user exposure that is substantially below the FCC recommended limits.

General Safety Guidelines

Do not hold any component containing a radio so that the antenna is very close to or touching any exposed parts of the body, especially the face or eyes, while transmitting.

Warnings

Translated versions of the following safety warnings are provided in Appendix A, “Translated Safety Warnings.”

⚠️ Warning ⚠️

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device.

Statement 1071
SAVE THESE INSTRUCTIONS

⚠️ Warning ⚠️

Read the installation instructions before you connect the system to its power source. Statement 1004

⚠️ Warning ⚠️

This product must be connected to a power-over-ethernet (PoE) IEEE 802.3af compliant power source or an IEC60950 compliant limited power source. Statement 353

⚠️ Warning ⚠️

This product relies on the building’s installation for short-circuit (overcurrent) protection. Ensure that the protective device is rated not greater than: 20A Statement 1005

⚠️ Warning ⚠️

Do not operate your wireless network device near unshielded blasting caps or in an explosive environment unless the device has been modified to be especially qualified for such use. Statement 245B
Warning

In order to comply with FCC radio frequency (RF) exposure limits, antennas should be located at a minimum of 7.9 inches (20 cm) or more from the body of all persons. Statement 332

Unpacking the Access Point

Follow these steps to unpack the access point:

Step 1
Open the shipping container and carefully remove the contents.

Step 2
Return all packing materials to the shipping container and save it.

Step 3
Ensure that all items listed in the “Package Contents” section are included in the shipment. Check each item for damage. If any item is damaged or missing, notify your authorized Cisco sales representative.

Package Contents

Each access point package contains the following items:

- Cisco Aironet 1240AG Series Access Point or Cisco Aironet 1240AG Series Lightweight Access Point
- Cisco Aironet 1240AG Series Power Module (universal power module)—optional
- Mounting hardware kit
  - One mounting plate with cable security bracket
  - Two suspended ceiling T-rail clips, spacers (accommodates standard and recessed T-rails), and nuts.
  - One security hasp
  - Two 6 x 32 x 1/2 in. pan head Phillips machine screws
  - Four 8 x 18 x 3/4 in. pan head Phillips sheet metal screws
  - Four #8 plastic wall anchors
  - One 10 x 24 nut (for ground stud on mounting bracket)
  - Four rubber foot pads
  - Two cable tie wraps
- Product quick start guide
- Product translated safety warnings document
- Cisco product registration and Cisco documentation feedback cards
Basic Installation Guidelines

Because the access point is a radio device, it is susceptible to interference that can reduce throughput and range. Follow these basic guidelines to ensure the best possible performance:

- Ensure that a site survey has been performed to determine the optimum placement of access points.
- For lightweight access points, check the latest release notes to ensure that your controller software version supports the access points to be installed. You can find the controller release notes by selecting your controller under **Wireless LAN Controllers** at this URL:
  
- Ensure that access points are not mounted closer than 20 cm (7.9 in) from the body of all persons.
- Do not mount the access point within 3 feet of metal obstructions.
- Install the access point away from microwave ovens. Microwave ovens operate on the same frequency as the access point and can cause signal interference.
- Do not mount the access point outside of buildings.
- Do not mount the access points on building perimeter walls unless outside coverage is desired.

Controller Discovery Process for Lightweight Access Points

The lightweight access point supports these controller discovery processes:

- **DHCP server discovery**—Uses DHCP Option 43 to provide controller IP addresses to the access points. Cisco switches support a DHCP server option. For additional information, refer to the “Configuring DHCP Option 43 for Lightweight Access Points” section on page G-1.
- **DNS server discovery**—The access point uses the name *CISCO-LWAPP-CONTROLLER.*<local domain> to discover the controller IP addresses from a DNS server. Where <local domain> is the access point domain name.
- **Locally stored controller IP addresses**—If the access point was previously associated to a controller, the IP addresses of the primary, secondary, and tertiary controllers are stored in the access point non-volatile memory. The process of storing controller IP addresses in access points for later deployment is called priming the access point. For additional information, refer to the “Priming Lightweight Access Points Prior to Deployment” section on page F-1.

You can also manually configure controller information using CLI commands on new (out-of-the-box) access points that are not connected to a controller. For additional information refer to the “Manually Configuring Controller Information Using the Access Point CLI” section on page 4-7.

Cisco recommends that you configure a DHCP server with Option 43 to provide the controller IP addresses to your access points. Cisco switches provide a DHCP server option that is typically used for this purpose.
Deploying the Access Points on the Wireless Network

Prior to beginning the actual access point deployment, perform these tasks:

- Ensure that a site survey has been performed.
- Ensure that your network infrastructure devices are operational and properly configured.
- For lightweight access points, perform these tasks:
  - Ensure that your controllers are connected to switch trunk ports.
  - Ensure that your switch is configured with untagged access ports for connecting your access points.
  - Ensure that a DHCP server with Option 43 configured is reachable by your access points.

To deploy your access points, follow these steps:

**Step 1** Obtain the access point location map created during your building site survey.

**Step 2** Review the access point locations and identify the specific mounting methods required for each access point location.

**Step 3** For each access point perform these steps:

a. For lightweight access points, record the access point MAC address on the access point location map. When you have completed the access point deployment, return the access point MAC addresses and the access point locations on the access point location maps or floor plans to your network planner or manager. The network operators can use the MAC address and location information to create maps for precise wireless system management.

b. Attach your access point to the mounting plate (see the “Attaching the Access Point to the Mounting Plate” section on page 2-16).

c. Mount the access point at the indicated destination using the specified mounting method. For specific mounting instructions, see these sections:
   - Horizontal or vertical surface, such as a ceiling or wall (see the “Mounting on a Horizontal or Vertical Surface” section on page 2-9).
   - Below a suspended ceiling (see the “Mounting Below a Suspended Ceiling” section on page 2-10).
   - Above a suspended ceiling (see the “Mounting Above a Suspended Ceiling” section on page 2-11).
   - On a desktop or shelf (see the “Mounting Access Point on a Desktop or Shelf” section on page 2-14).

d. Optionally secure the access point using a padlock or security cable (see the “Securing the Access Point” section on page 2-17).

e. Connect the access point cables (Ethernet, optional power, optional antennas). For instructions see the “Connecting the Ethernet and Power Cables” section on page 2-20.

f. On power up, verify that the access point is associated to a controller and operating normally. For additional information, refer to the “Checking the Lightweight Access Point LEDs” section on page 3-2 or the “Checking the Lightweight Access Point LEDs” section on page 4-3.
Step 4  For lightweight access points, after your access points are deployed, ensure that your controller is not configured as a master controller. A master controller should only be used for configuring access points and not in a working network.

Access Point Layout and Connectors

Figure 2-1 illustrates the 2.4-GHz connector end of the access point.

Mounting Overview

You can mount the access point on any of the following surfaces:

- Horizontal or vertical flat surfaces, such as walls or ceilings
- Suspended ceilings (above and below)

Caution

The access point, the antennas, and the power source (power injector or power module) are not designed for outdoor use and must be located in an indoor environment.

The access point ships with a detachable mounting plate and the necessary mounting hardware. Because it is detachable, you can use the mounting plate as a template to mark the positions of the mounting holes for your installation. You then install the mounting plate and attach the access point when you are ready. Refer to Figure 2-3 to locate the various mounting holes for the method you intend to use.

Caution

Only the fiber-optic power injector (AIR-PWRINJ-FIB) has been tested to UL 2043 for operation in a building’s environmental air space; no other power injectors or power modules have been tested to UL 2043 and they should not be placed in a building’s environmental air space, such as above suspended ceilings.
The access point provides adequate fire resistance and low smoke-producing characteristics suitable for operation in a building's environmental air space (such as above suspended ceilings) in accordance with Section 300-22(C) of the National Electrical Code (NEC).

When mounting the access point in a building’s environmental air space, you must use Ethernet cable suitable for operation in environmental air space in accordance with Section 300-22(C) of the National Electrical Code (NEC).

A mounting hardware kit is provided that contains the hardware and fasteners necessary to mount the access point. Refer to the Table 2-1 to identify the materials you need to mount your access point, then go to the section containing the specific mounting procedure.

**Table 2-1  Material Needed to Mount Access Point**

Mounting on a Horizontal or Vertical Surface

Follow these steps to mount the access point on a horizontal or vertical surface.

**Step 1** Use the mounting plate as a template to mark the locations of the four mounting holes.

*Note* When mounting on a vertical surface, position the cable security bracket on the bottom.

**Step 2** Drill one of the following sized holes at the locations you marked:
- 3/16 in. (4.7 mm) if you are using wall anchors
- 1/8 in. (6.3 mm) if you are not using wall anchors

**Step 3** Install the anchors into the wall if you are using them. Otherwise, go to Step 4.

**Step 4** Secure the mounting plate to the surface using the #8 fasteners.

*Note* On a vertical surface, mount the plate with the security hasp slot on the top.

**Step 5** Attach the access point to the mounting plate.

*Note* For a more secure installation you should attach the mounting plate to a stud or major structural member and use the appropriate fasteners.
Mounting Below a Suspended Ceiling

Note

To comply with NEC code, a #10-24 grounding lug is provided on the mounting plate.

You should review Figure 2-4 before beginning the mounting process.

Figure 2-4  T-Rail Mounting Parts

</tr>
<tr>
<td>Step 9</td>
<td>If you need additional security, refer to the “Securing the Access Point” section on page 2-17 for additional information.</td>
</tr>
<tr>
<td>Step 10</td>
<td>Verify the access point is operating (see the “Powering Up the Access Point” section on page 2-22).</td>
</tr>
</tbody>
</table>

**Mounting Above a Suspended Ceiling**

The access point mounting plate is designed to be integrated into the T-bar grid above the tiles of a suspended ceiling. Using a T-bar box hanger and bracket mounting clip (not supplied) such as the Erico 512A and BHC, you orient the access point antenna just above the top surface of a standard ceiling tile. You may need to modify a thicker tile to allow room for the antenna.
It may be helpful to refer to Figure 2-5 before proceeding.

**Figure 2-5  Above Suspended Ceiling Parts**

**Caution**

Only the fiber-optic power injector (AIR-PWRINJ-FIB) has been tested to UL 2043 for operation in a building’s environmental air space; no other power injectors or power modules have been tested to UL 2043 and they should not be placed in a building’s environmental air space, such as above suspended ceilings.
The bracket mounting clip requires the use of two mounting clip holes on the mounting plate (see Figure 2-6).

**Figure 2-6  Mounting Plate Holes**

![Figure 2-6 Mounting Plate Holes](image)

1. Bracket mounting clip holes

Follow these steps to mount the access point above a suspended ceiling.

**Step 1** Insert the bracket mounting clip’s tab into the large hole on the access point mounting plate.

**Step 2** Place the clip over the T-bar box hanger and secure it to the access point mounting plate (see Figure 2-7) with the 1/4-20 fastener (supplied with the T-bar hanger).

**Figure 2-7  Access Point Mounting Plate**

![Figure 2-7 Access Point Mounting Plate](image)

**Note** The illustration shows the access point mounting plate mounted perpendicular to the T-bar box hanger. You can also mount the bracket parallel to the T-bar box hanger.
**Step 3** Determine the location in the ceiling where you will mount the access point and remove an adjacent ceiling tile.

**Step 4** Orient the access point 2-GHz and 5-GHz antennas so that they are pointing down when mounted on the T-bar Box hanger.

**Step 5** Adjust the height of the T-bar box hanger to provide antenna clearance above the ceiling tile using the height adjusting screws (refer to Figure 2-5).

**Step 6** Attach the T-rail clips on each end of the T-bar box hanger to the ceiling grid T-rails. Make sure the clips are securely attached to the T-rails.

**Step 7** Connect a drop wire to a building structural element and through the hole provided in the bracket mounting clip. This additional support is required in order to comply with the U.S. National Electrical Safety Code.

**Step 8** To attach the access point to the mounting plate, see the “Attaching the Access Point to the Mounting Plate” section on page 2-16.

**Step 9** If you need additional security, see the “Securing the Access Point” section on page 2-17 for additional information.

**Step 10** Verify the access point is operating before replacing the ceiling tile (see the “Powering Up the Access Point” section on page 2-22).

---

**Mounting Access Point on a Desktop or Shelf**

When placing the access point on a desktop or shelf, the use of the mounting plate is optional. The mounting plate can be used to shield the user from the hot bottom surface of the access point when movement of the access point may be necessary. The access point is shipped with four rubber pads that you can place on the bottom of the access point or the mounting plate to help prevent sliding or scratching the surface of your desktop or shelf. For information on connecting the access point cables, see the “Connecting the Ethernet and Power Cables” section on page 2-20.

**Cable Security Bracket**

The access point mounting plate has an attached cable security bracket that covers the console port, Ethernet port, power port, and the mode button to prevent the installation or removal of the cables or the activation of the mode button. If desired, the cable security bracket can be removed prior to attaching the mounting plate to a ceiling or wall.
Removing the Cable Security Bracket

The cable security bracket (see Figure 2-9) is designed to help prevent someone from using the Mode button to reset the access point to default values or from using the serial console cable to access the access point’s CLI interface or from removing the Ethernet cable. If this security protection is not considered necessary, you can remove the cable security bracket.
To remove the cable security bracket from the mounting plate, follow these instructions:

**Step 1**
Position the mounting plate with the cable security bracket pointing down (see Figure 2-9).

**Step 2**
Remove the two screws that attach the bracket to the mounting plate using a Phillips screwdriver.

---

**Attaching the Access Point to the Mounting Plate**

Follow these steps to attach the access point to the mounting plate:

**Step 1**
If your mounting plate has the cable security bracket, follow these steps:

a. Connect the Ethernet cable to the access point Ethernet port (see the “Connecting the Ethernet and Power Cables” section on page 2-20).

b. If not using on-line power, connect the power module’s power cable to the access point 48-VDC connector.

c. Carefully feed the Ethernet and power cables through the cable notch on the cable security bracket and slide the cables to the right or left to secure the cables (see the “Cable Security Bracket” section on page 2-14).

**Note**
If your access point is connected to Ethernet in-line power, do not connect the local power module to the access point. Using two power sources on the access point might cause the access point to shut down to protect internal components and might cause the switch to shut down the port to which the access point is connected. If your access point shuts down, you must remove all power and reconnect only a single power source.

**Step 2**
Line up the four keyhole clips on the mounting plate with the large ends of the keyhole-shaped holes on the access point.

**Note**
The keyhole clips on each side of the mounting plate are offset and can only be positioned in one direction onto the access point.

**Step 3**
Insert the mounting plate clips into the keyhole shaped holes on the access point.

**Step 4**
Slide the access point towards the cable security bracket end of the mounting bracket while exerting slight pressure to force the access point and mounting plate together. You will hear a slight click when the locking detents contact the access point and locks it into place.

**Step 5**
Attach and adjust the antenna(s) or antenna cables to the access point antenna connectors.

**Note**
The 5-GHz antennas and antenna cables have a blue dot or blue label. Connect only antennas or antenna cables with blue dots or labels to the access point’s 5-GHz antenna connectors.
Step 6  If your mounting plate does not have the cable security bracket, follow these steps:

   a. Connect a CAT 5 Ethernet cable to the access point Ethernet port (see the “Connecting the Ethernet and Power Cables” section on page 2-20).

   b. If using local power, insert the power module’s power cable into the access point’s 48-VDC power port.

Note  If your access point is connected to in-line power, do not connect the power module to the access point. Using two power sources on the access point might cause the access point to shut down to protect internal components and might cause the switch to shut down the port to which the access point is connected. If your access point shuts down, you must remove all power and reconnect only a single power source.

Securing the Access Point

There are two ways to secure your access point:

- Using a security cable
- Securing the access point to the mounting plate

Using a Security Cable

You can secure the access point by installing a standard security cable (such as the Kensington Notebook MicroSaver, model number 64068) into the access point security cable slot (see Figure 2-2). The security cable can be used with any of the mounting methods described in this guide.

Follow these steps to install the security cable.

Step 1  Loop the security cable around a nearby immovable object.

Step 2  Insert the key into the security cable lock.

Step 3  Insert the security cable latch into the security key slot on the access point.

Step 4  Rotate the key right or left to secure the security cable lock to the access point.

Step 5  Remove the key from security cable lock.
Securing the Access Point to the Mounting Plate

The security hasp enables you to use a padlock to secure the access point to the mounting plate. Known compatible padlocks are Master Lock models 120T or 121T.

To install the security hasp, follow these steps:

**Step 1**  
Insert the security hasp’s key pin (see Figure 2-10) into the key slot on the access point (see Figure 2-2) and rotate counterclockwise towards the mounting plate.

*Figure 2-10  Security Hasp*

<p>| | |</p>
<table>
<thead>
<tr>

<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key pin</td>
</tr>
<tr>
<td>2</td>
<td>Security hasp</td>
</tr>
<tr>
<td>3</td>
<td>Mounting plate security slot</td>
</tr>
</tbody>
</table>

**Step 2**  
Push the security hasp’s padlock flange through the mounting plate’s security slot.
Step 3  Place your padlock (user supplied) through the padlock hole in the security hasp’s padlock flange (see Figure 2-11).

Figure 2-11   Security Hasp and Padlock

| 1  | Security hasp          | 2  | Pad lock         |

Step 4  Push the padlock into the recessed opening between the access point and the mounting plate.

Note  When attaching the mounting plate to a vertical surface, place the security cable bracket end of the mounting plate on the bottom.
Connecting the Ethernet and Power Cables

The access point receives power through the Ethernet cable or an external power module. Figure 2-12 shows the power options for the access point.

Figure 2-12  Access Point Power Options

Warning  This product must be connected to a Power over Ethernet (PoE) IEEE 802.3af compliant power source or an IEC60950 compliant limited power source. Statement 353

Caution  This product and all interconnected equipment must be installed indoors within the same building, including the associated LAN connections (as defined by Environment A of the IEEE 802.3af standard).

The access point power options:

- Option 1—Switches with sufficient inline power:
  - An inline power capable switch, such as the Cisco Catalyst 3550 PWR XL, 3560-48PS, 3750-48PS, 4500 with 802.3AF PoE module, or the 6500 with 802.3AF PoE module
  - Other inline power switches supporting the IEEE 802.3af inline power standard
- Option 2—Switches without sufficient inline power can use the power injector:
  - Cisco Aironet Power Injector (AIR-PWRINJ3 or AIR-PWRINJ-FIB)
- Option 3—Local power using the power module
Chapter 2 Installing the Access Point

Connecting the Ethernet and Power Cables

Note

Some older switches and patch panels might not provide enough power to operate the access point. At power-up, if the access point is unable to determine that the power source can supply sufficient power, the access point automatically deactivates both radios to prevent an over-current condition. The access point Status LED turns amber and an error log entry is created (refer to the “Checking the Lightweight Access Point LEDs” section on page 3-2 or the “Checking the Lightweight Access Point LEDs” section on page 4-3).

Connecting to an Ethernet Network with an Inline Power Source

Caution

Be careful when handling the access point; the bottom plate might be hot.

Note

If your access point is connected to in-line power, do not connect the power module to the access point. Using two power sources on the access point might cause the access point to shut down to protect internal components and might cause the switch to shut down the port to which the access point is connected. If your access point shuts down, you must remove all power and reconnect only a single power source.

Follow these steps to connect the access point to the Ethernet LAN when you have an inline power source:

Step 1

Connect a Category 5 Ethernet cable to the RJ-45 Ethernet connector labeled Ethernet on the access point (see Figure 2-13).

Figure 2-13 Ethernet and Power Ports

![Ethernet and Power Ports Diagram](image)

| 1 | Ethernet port |
| 2 | 48 VDC power port |

Step 2

Connect the other end of the Ethernet cable to one of the following:

- A switch with inline power (see the “Connecting the Ethernet and Power Cables” section on page 2-20).
- The end of a Cisco Aironet power injector labeled To AP/Bridge. Connect the other end labeled To Network to your 10/100 Ethernet LAN.
Connecting to an Ethernet Network with Local Power

Caution
Be careful when handling the access point; the bottom plate might be hot.

Note
If your access point is connected to in-line power, do not connect the power module to the access point. Using two power sources on the access point might cause the access point to shut down to protect internal components and might cause the switch to shut down the port to which the access point is connected. If your access point shuts down, you must remove all power and reconnect only a single power source.

Follow these steps to connect the access point to an Ethernet LAN when you are using a local power source:

Step 1
Connect a Category 5 Ethernet cable to the RJ-45 Ethernet connector labeled Ethernet on the access point (see Figure 2-13).

Step 2
Connect the power module output connector to the access point’s 48-VDC power port (see Figure 2-13).

Step 3
Plug the other end of the Ethernet cable into an unpowered Ethernet port on your LAN network.

Step 4
Plug the other end of the power module into an approved 100- to 240-VAC outlet.

For information on securing your access point, see the “Securing the Access Point” section on page 2-17.

Powering Up the Access Point

When power is applied to the access point, it begins a routine power-up sequence that you can monitor by observing the three LEDs on the end of the access point. After you observe all three LEDs turning green to indicate the starting of the operating system, the Status LED blinks green signifying that the access point is operational. After a successful power-up sequence, the Status LED turns light green to signify that there are no client devices associated, or it turns blue to signify that there are client devices associated. Refer to the “Checking the Lightweight Access Point LEDs” section on page 3-2 or the “Checking the Lightweight Access Point LEDs” section on page 4-3 for LED descriptions.

Caution
Be careful when handling the access point; the bottom plate might be hot.

Note
If your access point is connected to in-line power, do not connect the power module to the access point. Using two power sources on the access point might cause the access point to shut down to protect internal components and might cause the switch to shut down the port to which the access point is connected. If your access point shuts down, you must remove all power and reconnect only a single power source.
Troubleshooting 1240AG Series Autonomous Access Points

This chapter provides troubleshooting procedures for basic problems with the 1240AG series autonomous access point (AIR-AP1242AG or AIR-AP1242G). For the most up-to-date, detailed troubleshooting information, refer to the Cisco Technical Support and Documentation website at the following URL:

Sections in this chapter include:

- Checking the Autonomous Access Point LEDs, page 3-2
- Checking Basic Settings, page 3-3
- Low Power Condition, page 3-5
- Running the Carrier Busy Test, page 3-13
- Running the Ping Test, page 3-14
- Resetting to the Default Configuration, page 3-14
- Reloading the Access Point Image, page 3-16
- Obtaining the Access Point Image File, page 3-19
- Obtaining the TFTP Server Software, page 3-20
Checking the Autonomous Access Point LEDs

If your access point is not working properly, check the Status, Ethernet, and Radio LEDs on the 2.4 GHz end of the unit. You can use the LED indications to quickly assess the unit’s status. Figure 3-1 shows the access point LEDs (for additional information refer to the Event Log using the access point browser interface).

![Access Point LEDs](image)

The LED signals are listed in Table 3-1.

Checking Basic Settings

Mismatched basic settings are the most common causes of lost connectivity with wireless clients. If the access point does not communicate with client devices, check the following areas.

</table>
Default IP Address Behavior

When you connect a 1240 series access point running Cisco IOS Release 12.3(7)JA or later software with a default configuration to your LAN, the access point requests an IP address from your DHCP server and, if it does not receive an IP address, continues to send requests indefinitely.

Enabling the Radio Interfaces

In Cisco IOS Release 12.3(7)JA or later, the access point radios are disabled by default, and there is no default SSID. You must create an SSID and enable the radios before the access point will allow wireless associations from other devices. These changes to the default configuration improve the security of newly installed access points. Refer to the Cisco IOS Software Configuration Guide for Cisco Aironet Access Points for instructions on configuring the SSID.

To enable the radio interfaces, follow these instructions:

Step 1 Use your web-browser to access your access point.
Step 2 At the prompts, enter the administrator username and password. The default username is Cisco and the default password is Cisco. The username and password are case sensitive.
Step 3 When the Summary Status page displays, click Network Interfaces > Radio0-802.11G and the radio status page displays.
Step 4 Click Settings and the radio settings page displays.
Step 5 Click Enable in the Enable Radio field.
Step 6 Click Apply.
Step 7 Click Radio1-802.11A and the radio status page displays.
Step 8 Repeat Steps 3 to 5.
Step 9 Close your web-browser.

SSID

Wireless clients attempting to associate with the access point must use the same SSID as the access point. If a client device’s SSID does not match the SSID of an access point in radio range, the client device will not associate.

Note In Cisco IOS Release 12.3(7)JA or later, there is no default SSID. You must configure an SSID before client devices can associate to the access point.
WEP Keys

The WEP key you use to transmit data must be set up exactly the same on your access point and any wireless devices with which it associates. For example, if you set WEP Key 3 on your client adapter to 0987654321 and select it as the transmit key, you must also set WEP Key 3 on the access point to exactly the same value. The access point does not need to use Key 3 as its transmit key, however.

Refer to the Cisco IOS Software Configuration Guide for Cisco Aironet Access Points for instructions on setting the access point’s WEP keys.

Security Settings

Wireless clients attempting to authenticate with your access point must support the same security options configured in the access point, such as EAP or LEAP, MAC address authentication, Message Integrity Check (MIC), WEP key hashing, and 802.1X protocol versions.

If a wireless client is unable to authenticate with your access point, contact the system administrator for proper security settings in the client adapter and for the client adapter driver and firmware versions that are compatible with the access point settings.

Note

The access point MAC address that displays on the Status page in the Aironet Client Utility (ACU) is the MAC address for the access point radio. The MAC address for the access point Ethernet port is printed on the label on the back of the access point.

Low Power Condition

Warning

This product must be connected to a Power over Ethernet (PoE) IEEE 802.3af compliant power source or an IEC60950 compliant limited power source. Statement 353

The access point can be powered from the 48-VDC power module or from an in-line power source. The access point supports the IEEE 802.3af power standard, Cisco Pre-Standard PoE protocol, and Cisco Intelligent Power Management for in-line power sources.

For full operation, the access point (powered device) requires 12.95 W (up to 15.4 W with 100 m CAT 5 Ethernet cable). When the access point is being used in a PoE configuration, the power drawn from the power sourcing equipment (PSE), such as a switch or power injector, is higher by an amount dependent on the length of the interconnecting cable.

The power module and Cisco Aironet power injectors are capable of supplying the required power for full operation, but some inline power sources are not capable of supplying sufficient power. Also, some high-power inline power sources, might not be able to provide up to 15.4 W of power to all ports at the same time.

Note

An 802.3af compliant switch (Cisco or non-Cisco) is capable of supplying sufficient power for full operation.
Low Power Condition

Note

If your access point is connected to in-line power, do not connect the power module to the access point. Using two power sources on the access point might cause the access point to shut down to protect internal components and might cause the switch to shut down the port to which the access point is connected. If your access point shuts down, you must remove all power and reconnect only a single power source.

On power up, the access point is placed into low power mode (both radios are disabled), Cisco IOS software loads and runs, and power negotiation determines if sufficient power is available. If there is sufficient power then the radios are turned on; otherwise, the access point remains in low power mode with the radios disabled to prevent a possible over-current condition. In low power mode, the access point activates the Status LED low power error indication, displays a low power message on the browser and serial interfaces, and creates an event log entry (see the “Checking the Lightweight Access Point LEDs” section on page 3-2 and “Inline Power Status Messages” section on page 3-7).

Intelligent Power Management

The access point requires 12.95 W of power (up to 15.4 W with 100 m CAT 5 Ethernet cable) for full power operation with both radios, but only needs 6.3 W of power when operating in low power mode with both radios disabled. To help avoid an over-current condition with low power sources and to optimize power usage on Cisco switches, Cisco developed Intelligent Power Management, which uses Cisco Discovery Protocol (CDP) to allow powered devices (such as your access point) to negotiate with a Cisco switch for sufficient power.

The access point supports Intelligent Power Management and as a result of the power negotiations, the access point will either enter full power mode or remain in low power mode with the radios disabled.

Note

Independent of the power negotiations, the access point hardware also uses the 802.3af classification scheme to indicate the power required from the power source. However, the power source cannot report the power available to the access point unless the power source also supports Intelligent Power Management.

Some Cisco switches that are capable of supplying sufficient power require a software upgrade to support Intelligent Power Management. If the software upgrade is not desired, you can configure the access point to operate in pre-standard compatibility mode and the access point automatically enters full power mode if these Cisco switches are detected in the received CDP ID field.

When the access point determines that sufficient power is not available for full power operation, an error message is logged and the Status LED turns amber to indicate low power mode (see the “Checking the Lightweight Access Point LEDs” section on page 3-2 and the “Inline Power Status Messages” section on page 3-7).

Tip

If your switch is capable of supplying sufficient power for full operation but the access point remains in low-power mode, your access point or your switch (or both) might be misconfigured (see Table 3-2 and Table 3-3).
If your inline power source is not able to supply sufficient power for full operation, you should consider these options:

- Upgrade to a higher-powered switch
- Use a Cisco Aironet power injector on the switch port
- Use the 48-VDC power module to locally power the access point

### Inline Power Status Messages

These messages are logged on the console port by the access point to report the power condition:

- `%CDP_PD-4-POWER_OK: Full Power - AC_ADAPTOR inline power source—This message indicates the access point is using the power module and can support full-power operation.
- `%CDP_PD-4-POWER_OK: Full Power - NEGOTIATED inline power source—This message indicates the access point is operating at full power and has successfully negotiated for 12.95 W of power from a Cisco switch supporting Cisco Intelligent Power Management.
- `%CDP_PD-4-POWER_OK: Full Power - HIGH_POWER_CLASSIC inline power source—This message indicates the access point is operating at full power because it has been configured for pre-standard compatibility mode and has detected a Cisco switch that does not support Intelligent Power Management but is able to supply sufficient power to the access point.
- `%CDP_PD-4-POWER_OK: Full Power - INJECTOR_CONFIGURED_ON_SOURCE inline power source—This message indicates the access point is operating at full power because it is connected to a Cisco switch that supports Intelligent Power Management and the switch has been configured with the `power inline never` command.
- `%CDP_PD-4-POWER_OK: Full power - INJECTOR_CONFIGURED_ON_CURRENT_PORT inline power source—This message indicates the access point is operating at full power because it has been configured to expect a power injector on this port.
- `%CDP_PD-4-POWER_OK: Full Power - INJECTOR_DETECTED_PD inline power source—This message indicates the access point is operating at full power because it has detected multiple Cisco devices. The access point power is being supplied from a power injector or a non-Cisco power source because a Cisco power source does not transmit this type of CDP packet.
- `%CDP_PD-4-POWER_OK: Full Power - NON_CISCO-NO_CDP_RECEIVED inline power source—This message indicates the access point is operating at full power because it has not received any CDP packets within the timeout period. This condition indicates your access point is connected to a non-Cisco power source.

**Note**

To prevent possible over-current conditions, the power source must be an IEEE 802.3af compliant power source or an IEC60950 compliant limited power source.
• %CDP_PD-2-POWER_LOW: All radios disabled - NEGOTIATED inline power source—This message indicates the access point is in low power mode with all radios disabled because the Cisco power source has indicated it is not capable of supplying sufficient power to the access point.

Note A Cisco power injector might be required.

• %CDP_PD-2-POWER_LOW: All radios disabled - LOW_POWER_CLASSIC_NO_INJECTOR_CONFIGURED <platform name> (<MAC address>). —This message indicates the access point is in low power mode with all radios disabled and has detected a CDP device that is unable to supply sufficient power to the access point.

The <platform name> indicates the CDP device detected by the access point. The <MAC address> indicates the MAC address of the CDP device, typically, the switch port.

Note A Cisco power injector might be required.

Following the low power status message, two extra messages are displayed on the console port or when using a Telnet session that identify the actions needed to resolve this low power problem:

1. Verify the required power injector is installed on this port: <platform name> (<Ethernet port>).
   (where <platform name> indicates the CDP device detected by the access point and <Ethernet port> indicates the Ethernet port of the CDP device.

2. If a power injector is installed, issue the command: power inline negotiation injector installed.

• %CDP_PD-2-POWER_LOW: All radios disabled- LOW_POWER_CLASSIC_INJECTOR_CONFIGURED_ON_ANOTHER_PORT <platform name> (<MAC address>)—This message indicates the access point is in low power mode with all radios disabled and has detected a CDP device that is unable to supply sufficient power to the access point. A power injector has been configured, but it is for another port. It is likely that the access point has been relocated and has not been reconfigured for a new power injector.

The <platform name> indicates the CDP device detected by the access point. The <MAC address> indicates the MAC address of the CDP device, typically, the switch port.

Note A Cisco power injector might be required.

Following the low power status message, two extra messages are displayed when using the console port or a Telnet session that identify the actions needed to resolve this low power problem:

1. Verify the required power injector is installed on the new port: <platform name> (<Ethernet port>).
   (where <platform name> indicates the CDP device detected by the access point and <Ethernet port> indicates the Ethernet port of the CDP device.

2. If a power injector is installed, issue the command: power inline negotiation injector installed.

• %CDP_PD-2-POWER_LOW: All radios disabled- HIGH_POWER_CLASSIC_NOT_CONFIGURED inline power source <platform name> (<MAC address>)—This message indicates the access point is in low power mode with all radios disabled and has detected a Cisco switch that does not support Intelligent Power Management, but should be able to supply sufficient power. The access point must be configured for pre-standard compatibility.
Chapter 3  Troubleshooting 1240AG Series Autonomous Access Points

Low Power Condition

The `<platform name>` indicates the Cisco platform detected by the access point. The `<MAC address>` indicates the MAC address of the switch port.

| Note | You need to upgrade the software on the Cisco switch to support Intelligent Power Management or configure the access point for pre-standard compatibility. |

- `%CDP_PD-4-POWER_OK: Full power - INJECTOR_CONFIGURED_OVERRIDE_SAFETY` inline power source — This message indicates the access point has been configured to override the inline power checks and a power injector is installed.

| Caution | When using the `power inline negotiation injector override` command, a power injector must always be installed to prevent a possible overload condition with an underpowered power source. |

## Configuring Power Using the CLI

Intelligent Power Management support is dependent on the version of software resident in the Cisco switch that is providing power to the access point. Each Cisco switch should be upgraded to support Intelligent Power Management. Until the software is upgraded, you can configure the access point to operate with older switch software using the following Cisco IOS CLI command:

```plaintext
[no] power inline negotiation {prestandard source | injector {installed | override | H.H.H}}
```

(prestandard source indicates the Cisco switch does not support Intelligent Power Management. injector installed indicates a power injector is installed on the current switch port. injector override indicates a power injector is installed and the access point is configured to override the inline power checks. When you move the access point, H.H.H is used to specify the MAC address of the new switch port where the access point was moved. A MAC address of 0.0.0 is invalid.)

| Caution | When using the `power inline negotiation injector override` command, a power injector must always be installed to prevent a possible overload condition with an underpowered power source. |

| Note | The `power inline negotiation injector installed` command will fail if CDP is disabled. |

When using the power inline negotiation injector override command, you must use a power injector to prevent possibly overloading underpowered power sources.

You can use this Cisco IOS CLI command to inform the access point of the following:

- The Cisco switch does not support Intelligent Power Management but should be able to supply sufficient power.
- A power injector is being used to supply sufficient power and the Cisco switch does not support Intelligent Power Management.
- The access point was moved to a new Cisco switch port and a power injector is being used to supply sufficient power.
Caution

If the access point receives power through PoE, the output current of the power sourcing equipment (PSE) cannot exceed 400 mA per port. The power source must comply with IEEE802.3af or IEC60950 for limited power sources.

Note

After completing your configuration changes, you must remove the serial console cable from the access point.

</table>

1. You should check the release notes for your Cisco power source to determine which Cisco IOS release supports Intelligent Power Management. Support for Intelligent Power Management might not be currently available for your Cisco power source.
2. Power injector must be AIR-PWRINJ3 or AIR-PWRINJ-FIB.
3. The Cisco switch uses Intelligent Power Management to inform the access point of the power injector being used.
4. Cisco switches that support Intelligent Power Management always configure the use of a power injector at the switch.

Issuing the Cisco IOS Command Using the CLI

Follow these steps to issue the Cisco IOS command for your power scenario:

Step 1  Connect a PC to the access point console port and use a terminal emulator to establish a session with the access point (refer to the “Connecting to the Access Point Locally” section on page 3-20).

Step 2  From the global configuration mode (refer to the Cisco IOS Software Configuration Guide for Cisco Aironet Access Points), enter the command below that applies to your power configuration (see Table 3-2):

- power inline negotiation injector installed
- no power inline negotiation injector
- power inline negotiation prestandard source
- no power inline negotiation prestandard source
Step 3 Enter the **write memory** command to save the setting to the access point memory.

Step 4 Enter the **quit** command to exit the terminal session.

### Configuring the Access Point System Power Settings Using a Browser

You can also use your browser to set the access point System Power Settings.

**Note**

The access point web-browser interface is fully compatible with Microsoft Internet Explorer version 6.0 on Windows 98 and 2000 platforms and with Netscape version 7.0 on Windows 98, Windows 2000, and Solaris platforms.

**Note**

When using the access point browser interface, you should disable your browser pop-up blocker.

Figure 3-2 shows the system power setting options and indicates the power status of the access point.

**Figure 3-2  System Power Settings**

![System Power Settings](image)

**Caution**

If the access point receives power through PoE, the output current of the power sourcing equipment (PSE) cannot exceed 400 mA per port. The power source must comply with IEEE802.3af or IEC60950 for limited power sources.

Table 3-3 lists the access point system power settings and the Cisco switch power commands for several power options.

**Table 3-3  Access Point System Power Settings and Cisco Switch Commands**

### Chapter 3  Troubleshooting 1240AG Series Autonomous Access Points

#### Low Power Condition

**Perform** these steps to configure your access point power settings using the browser interface:

**Step 1**  Obtain the access point IP address and browse to your access point.

**Step 2**  At the prompt, enter the administrator username and password. The default username is *Cisco* and the default password is *Cisco*. The username and password are case sensitive.

**Step 3**  Perform one of these operations:

- a. When you browse to your access point operating in low-power mode, a Warning message displays indicating that all radios are disabled due to insufficient power. Click OK to jump to the System Power Settings located on the *System Software > System Configuration* page.

- b. When you browse to your access point operating in full-power mode, choose *System Software > System Configuration*.

**Step 4**  Choose one of these Power Settings options (see Figure 3-2):

- a. If your Cisco switch supports Intelligent Power Management negotiations, choose *Power Negotiation*.

- b. If your Cisco switch does not support Intelligent Power Management negotiations, choose *Pre-standard Compatibility*.

- c. If you are using a non-Cisco switch, changes to the power settings are not required.

---

### Table 3-3  Access Point System Power Settings and Cisco Switch Commands (continued)

<table>
<thead>
<tr>
<th>Power Source</th>
<th>Access Point System Power Settings</th>
<th>Cisco Switch Power Command</th>
</tr>
</thead>
</table>
| Cisco switch that does not support Intelligent Power Management¹ | Power Settings:  
- *Pre-standard Compatibility* (selected)  
- *Installed on Port with MAC Address* (unchecked) | power inline auto |
| Power injector² used with a Cisco switch that supports Intelligent Power Management¹ | Power Settings:  
- *Power Negotiation* (selected)  
- *Installed on Port with MAC Address* (unchecked) | power inline never³ |
| Power injector² used with a Cisco switch that does not support Intelligent Power Management¹ | Power Settings:  
- *Power Negotiation* (selected)  
- *Installed on Port with MAC Address* (checked) | power inline never |
| Power injector used with a non-Cisco switch | Configuration changes are not required | – |
| 802.3af compliant non-Cisco switches | Configuration changes are not required | – |

---

1. You should check the release notes for your Cisco power source to determine which Cisco IOS release supports Intelligent Power Management. Support for Intelligent Power Management might not be currently available for your Cisco power source.
2. Power injector must be AIR-PWRINJ3 or AIR-PWRINJ-FIB.
3. Cisco switches that support Intelligent Power Management always configure the use of a power injector at the switch.
Step 5  If you are using a power injector with a Cisco switch, choose one of these Power setting options (see Figure 3-2):

a. If your Cisco switch supports Intelligent Power Management negotiations, uncheck **Installed on Port with MAC address**.

b. If your Cisco switch does not support Intelligent Power Management, check **Installed on Port with MAC address** and ensure the MAC address for your switch port is displayed in the MAC address field. The HHHH.HHHH.HHHH indicates the MAC address contains 12 hexadecimal digits.

**Note**  The MAC address field is not case-sensitive.

Step 6  Click **Apply** and a message displays indicating that you should disable pop-up blockers before proceeding.

Step 7  Click **OK** to continue. Your access point reboots and your power settings are configured in the access point.

**Note**  You might have to refresh your browser page to obtain the latest browser page that indicates your radios are enabled.

---

**Running the Carrier Busy Test**

You can use the carrier busy test to determine the least congested channel for a radio interface (802.11g or 802.11a). You should typically run the test several times over several days to obtain the best results and to avoid temporary activity spikes.

**Note**  The carrier busy test is primarily used for single access points or bridge environments. For sites with multiple access points, a site survey is typically performed to determine the best operation location and operating frequency for the access points.

**Note**  All associated clients on the selected radio will be deassociated during the 6 to 8 seconds needed for the carrier busy test.

Perform these steps to activate the carrier busy test:

Step 1  Use your web browser to access the access point browser interface.

Step 2  At the prompt, enter the administrator username and password. The default username is **Cisco** and the default password is **Cisco**. The username and password are case sensitive.

Step 3  Click **Network Interfaces** and the Network Interface Summary page displays.

Step 4  Choose the radio interface experiencing problems by clicking **Radio0-802.11G** or **Radio1-802.11A**. The respective radio status page displays.

Step 5  Click the **Carrier Busy Test** tab and the Carrier Busy Test page displays.
Running the Ping Test

You can use the ping test to evaluate the link to and from an associated wireless device. The ping test provides two modes of operation:

a. Performs a test using a specified number of packets and then displays the test results.

b. Performs a test that continuously operates until you stop the test and then displays the test results.

Follow these steps to activate the ping test:

**Step 1** Use your web browser to access the access point browser interface.

**Step 2** At the prompt, enter the administrator username and password. The default username is Cisco and the default password is Cisco. The username and password are case sensitive.

**Step 3** Click Association and the main association page displays.

**Step 4** Click the MAC address of an associated wireless device and the Statistics page for that device displays.

**Step 5** Click the Ping/Link Test tab and the Ping/Link Test page displays.

**Step 6** If you want to specify the number of packets to use in the test, follow these steps:
   a. Enter the number of packets in the Number of Packets field.
   b. Enter the packet size in the Packet Size field.
   c. Click Start.

**Step 7** If you want to use a continuous test, follow these steps:
   a. Enter the packet size in the Packet Size field.
   b. Click Start to activate the test.
   c. Click Stop to stop the test.

When the test has completed, the test results are displayed at the bottom of the page. You should check for any lost packets that can indicate a problem with the wireless link. For best results, you should also perform this test several times.

Resetting to the Default Configuration

If you forget the password that allows you to configure the access point, you may need to completely reset the configuration. You can use the MODE button on the access point or the web-browser interface.

**Note** The following steps reset all configuration settings to factory defaults, including passwords, WEP keys, the IP address, and the SSID.
Using the MODE Button

Follow these steps to delete the current configuration and return all access point settings to the factory defaults using the MODE button:

**Step 1** Disconnect power (the power jack for external power or the Ethernet cable for in-line power) from the access point.

**Step 2** Press and hold the MODE button while you reconnect power to the access point.

**Step 3** Hold the MODE button until the Ethernet LED turns an amber color (approximately 2 to 3 seconds), and release the button.

**Step 4** After the access point reboots, you must reconfigure the access point by using the Web browser interface, the Telnet interface, or Cisco IOS commands.

*Note* The access point is configured with the factory default values including the IP address (set to receive an IP address using DHCP).

Using the Web Browser Interface

Follow these steps to delete the current configuration and return all access point settings to the factory defaults using the web browser interface.

**Step 1** Open your Internet browser.

*Note* The access point web-browser interface is fully compatible with Microsoft Internet Explorer version 6.0 on Windows 98 and 2000 platforms and with Netscape version 7.0 on Windows 98, Windows 2000, and Solaris platforms.

*Note* When using the access point browser interface, you should disable your browser pop-up blocker.

**Step 2** Enter the access point’s IP address in the browser address line and press Enter. An Enter Network Password page displays.

**Step 3** At the prompt, enter the administrator username and password. The default username is Cisco and the default password is Cisco. The username and password are case sensitive. The Summary Status page displays.

**Step 4** Click System Software and the System Software page displays.

**Step 5** Click System Configuration and the System Configuration page displays.
Step 6  Click the **Reset to Defaults** button.

---

**Note**  If the access point is configured with a static IP address, the IP address does not change.

Step 7  After the access point reboots, you must reconfigure the access point by using the Web browser interface, the Telnet interface, or Cisco IOS commands.

---

## Reloading the Access Point Image

If your access point has a firmware failure, you must reload the complete access point image file using the Web browser interface or by using the MODE button. You can use the browser interface if the access point firmware is still fully operational and you want to upgrade the firmware image. However, you can use the MODE button when the access point has a corrupt firmware image.

### Using the MODE Button

You can use the MODE button on the access point to reload the access point image file from an active Trivial File Transfer Protocol (TFTP) server on your network or on a PC connected to the access point Ethernet port.

---

**Note**  If your access point experiences a firmware failure or a corrupt firmware image, indicated by the Status LED turning an amber color, you must reload the image from a connected TFTP server.

---

**Note**  This process resets all configuration settings to factory defaults, including passwords, WEP keys, the access point IP address, and SSIDs.

Follow these steps to reload the access point image file:

---

**Step 1**  The PC you intend to use must be configured with a static IP address in the same subnet as the access point.

**Step 2**  Place a copy of the access point image file (such as c1240-k9w7-tar.123-8.JA.tar) into the TFTP server folder on your PC. For additional information, refer to the “Obtaining the Access Point Image File” and “Obtaining the TFTP Server Software” sections.

**Step 3**  Rename the access point image file in the TFTP server folder to **c1240-k9w7-tar.default**.

**Step 4**  Activate the TFTP server.

**Step 5**  If using in-line power, use a Category 5 (CAT5) Ethernet cable to connect your PC to the To Network Ethernet connector on the power injector.

**Step 6**  Disconnect power (the power jack for external power or the Ethernet cable for in-line power) from the access point.

**Step 7**  Press and hold the **MODE** button while you reconnect power to the access point.
Step 8  Hold the MODE button until the Radio LED turns a red color (approximately 20 to 30 seconds), and release the MODE button.

Step 9  After the access point reboots, you must reconfigure the access point by using the Web interface, the Telnet interface, or Cisco IOS commands.

---

Web Browser Interface

You can also use the Web browser interface to reload the access point image file. The Web browser interface supports loading the image file using HTTP or TFTP interfaces.

**Note**  Your access point configuration is not changed when using the browser to reload the image file.

---

Browser HTTP Interface

The HTTP interface enables you to browse to the access point image file on your PC and download the image to the access point. Follow these instructions to use the HTTP interface:

---

**Step 1**  Open your Internet browser.

**Note**  The access point web-browser interface is fully compatible with Microsoft Internet Explorer version 6.0 on Windows 98 and 2000 platforms and with Netscape version 7.0 on Windows 98, Windows 2000, and Solaris platforms.

**Note**  When using the access point browser interface, you should disable your browser pop-up blocker.

**Step 2**  Enter the access point’s IP address in the browser address line and press Enter. An Enter Network Password page displays.

**Step 3**  At the prompt, enter the administrator username and password. The default username is Cisco and the default password is Cisco. The username and password are case sensitive. The Summary Status page displays.

**Step 4**  Click the System Software tab and then click Software Upgrade. The HTTP Upgrade page displays.

**Step 5**  Click the Browse button to locate the access point image file (such as c1240-k9w7-tar.123-8.JA.tar) on your PC.

**Step 6**  Click the Upload button.

For additional information, click the Help icon on the Software Upgrade page.
Browser TFTP Interface

The TFTP interface allows you to use a TFTP server on a network device to load the access point image file. Follow these instructions to use a TFTP server:

**Step 1** Open your Internet browser.

**Note** The access point web-browser interface is fully compatible with Microsoft Internet Explorer version 6.0 on Windows 98 and 2000 platforms and with Netscape version 7.0 on Windows 98, Windows 2000, and Solaris platforms.

**Note** When using the access point browser interface, you should disable your browser pop-up blocker.

**Step 2** Enter the access point’s IP address in the browser address line and press **Enter**. An Enter Network Password page displays.

**Step 3** At the prompt, enter the administrator username and password. The default username is **Cisco** and the default password is **Cisco**. The username and password are case sensitive. The Summary Status page displays.

**Step 4** Click the **System Software** tab and then click **Software Upgrade**. The HTTP Upgrade page displays.

**Step 5** Click the **TFTP Upgrade** tab.

**Step 6** Enter the IP address for the TFTP server in the TFTP Server field.

**Step 7** Enter the file name for the access point image file (such as c1240-k9w7-tar.123-8.JA.tar) in the Upload New System Image Tar File field. If the file is located in a subdirectory of the TFTP server root directory, include the relative path of the TFTP server root directory with the filename. If the file is located in the TFTP root directory, enter only the filename.

**Step 8** Click the **Upload** button.

**Step 9** When a message displays that indicates the upgrade is complete, click **OK**.

For additional information click the **Help** icon on the Software Upgrade page.
Obtaining the Access Point Image File

The access point image file can be obtained from the Cisco.com software center using these steps:

**Step 1** Use your Internet browser to access the Cisco Software Center at the following URL:

**Step 2** Click Wireless LAN Access > Aironet Access Points > Cisco Aironet 1240 AG Series.

**Step 3** Click Cisco Aironet 1240AG Access Point.

**Step 4** On the Enter Network Password window, enter your Cisco.com username and password and click OK.

**Step 5** Click IOS.

**Step 6** Choose the Cisco IOS release desired, such as 12.3.8.JA.

**Step 7** Click WIRELESS LAN for your access point image file, such as c1240-k9w7-tar.123-8.JA.tar.

**Step 8** On the Enter Network Password window, enter your Cisco.com username and password and click OK.

**Step 9** On the Security Information window, click Yes to display non-secure items.

**Step 10** On the Encryption Software Export Authorization page, read the information and check Yes or No to the question asking if the image is for use my you or your organization. Click Submit.

**Step 11** If you checked No, enter the requested information and click Submit.

**Step 12** Click Yes to continue.

**Step 13** Click DOWNLOAD.

**Step 14** Read and accept the terms and conditions of the Software Download Rules.

**Step 15** On the Enter Network Password window, enter your Cisco.com username and password and click OK.

**Step 16** Click Save to download your image file to your hard disk.

**Step 17** Select the desired download location on your hard disk and click Save.
Connecting to the Access Point Locally

If you need to configure the access point locally (without connecting the access point to a wired LAN), you can connect a PC to its console port using a DB-9 to RJ-45 serial cable.

⚠️ Caution

Be careful when handling the access point, the bottom plate might be hot.

🔍 Note

After completing your configuration changes, you must remove the serial cable from the access point.

Follow these steps to open the CLI by connecting to the access point console port:

Step 1

Connect a nine-pin, female DB-9 to RJ-45 serial cable to the RJ-45 console port on the access point and to the COM port on a computer. Figure 3-3 shows the console port location.

![Console Port Location](image)

Note

Step 2

Set up a terminal emulator on your PC to communicate with the access point. Use the following settings for the terminal emulator connection: 9600 baud, 8 data bits, no parity, 1 stop bit, and no flow control.

Step 3

At the prompts, enter the administrator username and password. The default username is`Cisco` and the default password is`Cisco`. The username and password are case sensitive.

Obtaining the TFTP Server Software

You can download TFTP server software from several web sites. Cisco recommends the shareware TFTP utility available at this URL:

[http://tftpd32.jounin.net](http://tftpd32.jounin.net)

Follow the instructions on the website for installing and using the utility.
Troubleshooting 1240AG Series Lightweight Access Points

This chapter provides troubleshooting procedures for basic problems with the 1240AG series lightweight access point (AIR-LAP1242AG or AIR-LAP1242G). For the most up-to-date, detailed troubleshooting information, refer to the Cisco Technical Support and Documentation website at the following URL:

Sections in this chapter include:

- Checking the Lightweight Access Point LEDs, page 4-3
- Low Power Condition for Lightweight Access Points, page 4-5
- Manually Configuring Controller Information Using the Access Point CLI, page 4-7
- Obtaining the Autonomous Access Point Image File, page 4-10
- Obtaining the TFTP Server Software, page 4-12
Guidelines for Using Cisco Aironet Lightweight Access Points

Keep these guidelines in mind when you use a 1240 series lightweight access point:

- The access points can only communicate with Cisco 2006 series wireless LAN controllers or 4400 series controllers.

**Note**

Cisco 4100 series, Airespace 4012 series, and Airespace 4024 series wireless LAN controllers are not supported because they lack the memory required to support access points running Cisco IOS software.

- The access points do not support Wireless Domain Services (WDS) and cannot communicate with WDS devices. However, the controller provides functionality equivalent to WDS when the access point associates to it.
- The access points support eight Basic Service Set Identifiers (BSSIDs) per radio and a total of eight wireless LANs per access point. When an access point associates to a controller, only wireless LANs with IDs 1 through 8 are pushed to the access point.
- The access points do not support Layer 2 LWAPP. They must get an IP address and discover the controller using DHCP, DNS, or IP subnet broadcast.
- The access point console port is enabled for monitoring and debug purposes (all configuration commands are disabled when connected to a controller).

**Using DHCP Option 43**

You can use DHCP Option 43 to provide a list of controller IP addresses to the access points, enabling the access point to find and join a controller. For additional information, refer to the “Configuring DHCP Option 43 for Lightweight Access Points” section on page G-1.
Checking the Lightweight Access Point LEDs

If your lightweight access point is not working properly, check the Status, Ethernet, and Radio LEDs on the 2.4 GHz end of the unit. You can use the LED indications to quickly assess the unit’s status. Figure 4-1 shows the access point LEDs (for additional information refer to the Event Log using the access point browser interface).

![Access Point LEDs](image)

The LED signals are listed in Table 4-1.

1. This status indication has the highest priority and overrides other status indications.

**Note:** If the access point remains in this mode for more than five minutes, the access point is unable to find the controller. Ensure a DHCP server is available or that controller information is configured on the access point.
Low Power Condition for Lightweight Access Points

**Warning** This product must be connected to a Power over Ethernet (PoE) IEEE 802.3af compliant power source or an IEC60950 compliant limited power source. Statement 353

The access point can be powered from the 48-VDC power module or from an in-line power source. The access point supports the IEEE 802.3af power standard, Cisco Pre-Standard PoE protocol, and Cisco Intelligent Power Management for in-line power sources.

For full operation, the access point (powered device) requires 12.95 W (up to 15.4 W with 100 m CAT 5 Ethernet cable). When the access point is being used in a PoE configuration, the power drawn from the power sourcing equipment (PSE), such as a switch or power injector, is higher by an amount dependent on the length of the interconnecting cable.

The power module and Cisco Aironet power injectors are capable of supplying the required power for full operation, but some inline power sources are not capable of supplying sufficient power. Also, some high-power inline power sources, might not be able to provide up to 15.4 W of power to all ports at the same time.

**Note** An 802.3af compliant switch (Cisco or non-Cisco) is capable of supplying sufficient power for full operation.

**Note** If your access point is connected to in-line power, do not connect the power module to the access point. Using two power sources on the access point might cause the access point to shut down to protect internal components and might cause the switch to shut down the port to which the access point is connected. If your access point shuts down, you must remove all power and reconnect only a single power source.

On power up, the access point is placed into low power mode (both radios are disabled), Cisco IOS software loads and runs, and power negotiation determines if sufficient power is available. If there is sufficient power then the radios are turned on; otherwise, the access point remains in low power mode with the radios disabled to prevent a possible over-current condition. In low power mode, the access point activates the Status LED low power error indication (see the “Checking the Lightweight Access Point LEDs” section on page 4-3).

**Intelligent Power Management**

The access point requires 12.95 W of power (up to 15.4 W with 100 m CAT 5 Ethernet cable) for full power operation with both radios, but only needs 6.3 W of power when operating in low power mode with both radios disabled. To help avoid an over-current condition with low power sources and to optimize power usage on Cisco switches, Cisco developed Intelligent Power Management, which uses Cisco Discovery Protocol (CDP) to allow powered devices (such as your access point) to negotiate with a Cisco switch for sufficient power.

The access point supports Intelligent Power Management and as a result of the power negotiations, the access point will either enter full power mode or remain in low power mode with the radios disabled.
Low Power Condition for Lightweight Access Points

Note

Independent of the power negotiations, the access point hardware also uses the 802.3af classification scheme to indicate the power required from the power source. However, the power source cannot report the power available to the access point unless the power source also supports Intelligent Power Management.

Some Cisco switches that are capable of supplying sufficient power require a software upgrade to support Intelligent Power Management. If the software upgrade is not desired, you can configure the access point to operate in pre-standard compatibility mode and the access point automatically enters full power mode if these Cisco switches are detected in the receive CDP ID field.

When the access point determines that sufficient power is not available for full-power operation, the radios are deactivated and the Status LED turns amber to indicate low power mode (see Table 4-1).

If your Cisco switch is capable of supplying sufficient power for full operation but the access point remains in low-power mode, your access point or your switch (or both) might be misconfigured (see Table 4-2).

If your inline power source is not able to supply sufficient power for full operation, you should consider these options (see Table 4-2):

- Upgrade to a higher-powered switch
- Use a Cisco Aironet power injector on the switch port
- Use the 48-VDC power module to locally power the access point

Configuring Power Using Controller CLI Commands

Intelligent Power Management support is dependent on the version of software resident in the Cisco switch that is providing power to the access point. Each Cisco switch should be upgraded to support Intelligent Power Management. Until the software is upgraded, you can use your controller to configure the access point to operate with older switch software using these controller CLI commands:

1) `config ap power pre-standard enable <ap>`
   where `<ap>` is the access point name on the controller

2) `config ap power injector enable <ap> <switch port MAC address>`
   (where `<ap>` is the access point name on the controller
   and `<switch port MAC address>` is the MAC address of the switch port to which the access point is connected)

Note

Refer to your controller documentation for instructions on using these commands.
You can use these controller CLI commands to inform the access point of the following:

- The Cisco switch does not support Intelligent Power Management but should be able to supply sufficient power.
- A power injector is being used to supply sufficient power and the Cisco switch does not support Intelligent Power Management.

Refer to Table 4-2 for information on when to use these special CLI controller commands and the corresponding Cisco switch power command.

**Caution**
If the access point receives power through PoE, the output current of the power sourcing equipment (PSE) cannot exceed 400 mA per port. The power source must comply with IEEE 802.3af or IEC60950 for limited power sources.

</tr>
</tbody>
</table>

1. You should check the release notes for your Cisco power source to determine which Cisco IOS release supports Intelligent Power Management. Support for Intelligent Power Management might not be currently available for your Cisco power source.
2. Power injector must be AIR-PWRINJ3 or AIR-PWRINJ-FIB.
3. Cisco switches that support Intelligent Power Management always configure the use of a power injector at the switch.

### Manually Configuring Controller Information Using the Access Point CLI

In a new installation, when your access point is unable to reach a DHCP server, you can manually configure needed controller information using the access point CLI. For information on how to connect to the console port, see the “Connecting to the Access Point Locally” section on page 4-11.

**Note**
The CLI commands in this section can be used only on an access point that is not associated to a controller.
The static information configured with the CLI commands are used by the access point to connect with a controller. After connecting with the controller, the controller reconfigures the access point with new controller settings, but the static IP addresses for the access point and the default gateway are not changed.

**Configuring Controller Information**

To manually configure controller information on a new (out-of-the-box) access point using the access point CLI interface, you can use these EXEC mode CLI commands:

```
AP# lwapp ap ip address <IP address> <subnet mask>
AP# lwapp ip default-gateway IP-address
AP# lwapp controller ip address IP-address
AP# lwapp ap hostname name
```

Where name is the access point name on the controller.

**Note**

The default (out-of-box) Enable password is *Cisco*.

**Clearing Manually Entered Controller Information**

When you move your access point to a different location in your network, you must clear the manually entered controller information to allow your access point to associate with a different controller.

**Note**

This command requires the controller configured Enable password to enter the CLI EXEC mode.

To clear or remove the manually entered controller information, you can use these EXEC mode CLI commands:

```
clear lwapp ap ip address
clear lwapp ip default-gateway
clear lwapp controller ip address
clear lwapp ap hostname
```

**Manually Resetting the Access Point to Defaults**

You can manually reset your access point to default settings using this EXEC mode CLI command:

**Note**

This command requires the controller configured Enable password to enter the CLI EXEC mode.

```
clear lwapp private-config
```
Returning the Lightweight Access Point to Autonomous Mode

You can return a lightweight access point to autonomous mode by loading a Cisco IOS release that supports autonomous mode (such as Cisco IOS Release 12.3(7)JA or earlier). If the access point is associated to a controller, you can use the controller to load the Cisco IOS release (refer to your controller documentation). If the access point is not associated to a controller, you can load the Cisco IOS release using TFTP.

Using a Controller to Return the Access Point to Autonomous Mode

Follow these steps to return a lightweight access point to autonomous mode using a controller:

**Step 1**
Log into the CLI on the controller to which the access point is associated and enter this command:

```
config ap tftp-downgrade tftp-server-ip-address filename access-point-name
```

(a) `tftp-server-ip-address` is the IP address of the TFTP server
(b) `filename` is the full path and filename of the access point image file, such as `D:/Images/c1240-k9w7-tar.123-7.JA.tar`
(c) `access-point-name` is the name that identifies the access point on the controller.

**Step 2**
Wait until the access point reboots, as indicated by all LEDs turning green followed by the Status LED blinking green.

**Step 3**
After the access point reboots, reconfigure it using the access point GUI or the CLI.

Using the MODE Button to Return the Access Point to Autonomous Mode

Follow these steps to return a lightweight access point to autonomous mode using the access point MODE button and a TFTP server:

**Note**
The access point MODE button is enabled by default, but you need to verify that the MODE button is enabled (see the “MODE Button Setting” section on page 4-10).

**Step 1**
Set the static IP address of the PC on which your TFTP server software runs to an address between 10.0.0.2 and 10.0.0.30.

**Step 2**
Make sure that the PC contains the access point image file (such as `c1240-k9w7-tar.123-7.JA.tar` for a 1240 series access point) in the TFTP server folder and that the TFTP server is activated.

**Step 3**
Rename the access point image file in the TFTP server folder to `c1240-k9w7-tar.default`.

**Step 4**
Connect the PC to the access point using a Category 5 (CAT5) Ethernet cable.

**Step 5**
Disconnect power from the access point.

**Step 6**
Press and hold the MODE button while you reconnect power to the access point.

**Step 7**
Hold the MODE button until the Radio LED turns red (approximately 20 to 30 seconds) and then release.
Obtaining the Autonomous Access Point Image File

The autonomous access point image file can be obtained from the Cisco.com software center using these steps:

**Note** To download software from the Cisco.com software center, you must be a registered user. You can register from the main Cisco.com web page at this URL: [http://cisco.com](http://cisco.com).

**Step 1** Use your Internet browser to access the Cisco Software Center at the following URL:

**Step 2** Click Wireless LAN Access > Aironet Access Points > Cisco Aironet 1240AG Series > Cisco Aironet 1240AG Access Point. The Enter Password window appears.

**Step 3** Enter your username and password in the respective fields and click **OK**. The **Select a Software Type** page appears.

**Step 4** Click **IOS** and the Select a Release page appears.

**Step 5** Click on the IOS release for the desired access point image file, such as 12.3.8-JA.

**Step 6** Click **Wireless LAN** and the Enter Password window appears.

**Step 7** Enter your username and password in the respective fields and click **OK**.

**Step 8** If you receive a *Do you want to display the nonsecure items?* message, click **Yes**.

**Step 9** On the Encryption Software Export Distribution Authorization Form, read the information and click the appropriate box.

**Step 10** Click **Submit**.

**Step 11** If you indicated that the software is not for you or your company, follow these steps:

a. If you receive a *Do you want to display the nonsecure items?* message, click **Yes**. The Encryption Software Export Distribution Authorization window appears.

---

**Step 8** Wait until the access point reboots, as indicated by all LEDs turning green followed by the Status LED blinking green.

**Step 9** After the access point reboots, reconfigure it using the access point GUI or the CLI.

**MODE Button Setting**

The lightweight access point MODE button is configured from your Cisco Wireless LAN Controller. Use these controller CLI commands to view and configure the MODE button:

1) `config ap rst-button enable <access-point-name>/all`
2) `config ap rst-button disable <access-point-name>/all`
3) `show ap config general <access-point-name>`

(where *access-point-name* is the name that identifies the access point on the controller.)
b. Carefully read the information and enter the Cisco.com user profile or detailed data describing the end user of this software image in the provided fields.

c. Click Submit.

Step 12 If you receive a Do you wish to continue? security alert message, click Yes to continue.

Step 13 Click Download.

Step 14 Carefully read the Software Download Rules and click Agree to download the image file. An Enter Password window appears.

Step 15 Enter your username and password in the respective fields and click OK.

Step 16 Download and save the image file to your hard drive and then exit the Internet browser.

---

**Connecting to the Access Point Locally**

If you need to configure the access point locally (without connecting the access point to a wired LAN), you can connect a PC to its console port using a DB-9 to RJ-45 serial cable.

**Caution**

Be careful when handling the access point, the bottom plate might be hot.

**Note**

After completing your configuration changes, you must remove the serial cable from the access point.

Follow these steps to open the CLI by connecting to the access point console port:

**Step 1** Connect a nine-pin, female DB-9 to RJ-45 serial cable to the RJ-45 console port on the access point and to the COM port on a computer.

Figure 4-2 shows the console port location.

**Figure 4-2 Console Port Location**

1 Console port

**Note**

Obtaining the TFTP Server Software

You can download TFTP server software from several web sites. Cisco recommends the shareware TFTP utility available at this URL:

http://tftpd32.jounin.net

Follow the instructions on the website for installing and using the utility.
Translated Safety Warnings

For translated safety warnings, refer to the safety warning document that shipped with your access point or that is available on Cisco.com.

To browse to the document on Cisco.com, follow these steps:

**Step 1**  Click this link to the Cisco Wireless documentation home page:

**Step 2**  Click Cisco Aironet 1240AG Series listed under Access Points.

**Step 3**  Click Install and Upgrade Guides.

**Step 4**  Click Safety Warnings for Cisco Aironet 1000, 1100, 1130AG, 1200, and 1240AG Series Access Points.
Declarations of Conformity and Regulatory Information

This appendix provides declarations of conformity and regulatory information for the Cisco Aironet 1240AG Series Access Points.

This appendix contains the following sections:

- VCCI Statement for Japan, page B-3
- Industry Canada, page B-4
- European Community, Switzerland, Norway, Iceland, and Liechtenstein, page B-4
- Declaration of Conformity for RF Exposure, page B-7
- Guidelines for Operating Cisco Aironet Access Points in Japan, page B-8
- Administrative Rules for Cisco Aironet Access Points in Taiwan, page B-9
- Operation of Cisco Aironet Access Points in Brazil, page B-11
- Declaration of Conformity Statements, page B-12
- Declaration of Conformity Statements for European Union Countries, page B-12
Manufacturers Federal Communication Commission Declaration of Conformity Statement

Autonomous Access Point Models:

FCC Certification number:
LDK102056

Manufacturer:
Cisco Systems, Inc.
170 West Tasman Drive
San Jose, CA 95134-1706
USA

This device complies with Part 15 rules. Operation is subject to the following two conditions:
1. This device may not cause harmful interference, and
2. This device must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits of a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a residential environment. This equipment generates, uses, and radiates radio frequency energy, and if not installed and used in accordance with the instructions, may cause harmful interference. However, there is no guarantee that interference will not occur. If this equipment does cause interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase separation between the equipment and receiver.
- Connect the equipment to an outlet on a circuit different from which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician.
Caution

The Part 15 radio device operates on a non-interference basis with other devices operating at this frequency when using the integrated antennas. Any changes or modification to the product not expressly approved by Cisco could void the user’s authority to operate this device.

Caution

Within the 5.15 to 5.25 GHz band (5 GHz radio channels 34 to 48) the U-NII devices are restricted to indoor operations to reduce any potential for harmful interference to co-channel Mobile Satellite System (MSS) operations.

VCCI Statement for Japan

Warning

This is a Class B product based on the standard of the Voluntary Control Council for Interference from Information Technology Equipment (VCCI). If this is used near a radio or television receiver in a domestic environment, it may cause radio interference. Install and use the equipment according to the instruction manual.

警告

VCCI 準拠クラスB機器（日本）

この装置は、情報処理装置等電波障害自主規制協議会（VCCI）の基準に基づくクラスB情報技術装置です。この装置は、家庭環境で使用することを目的としていますが、この装置がラジオやテレビジョン受信機に近接して使用されると、受信障害を引き起こすことがあります。取扱説明書に従って正しい取り扱いをしてください。
Industry Canada

- AIR-LAP1242G-A-K9

Certification number:
2461B-102055

Canadian Compliance Statement

This Class B Digital apparatus meets all the requirements of the Canadian Interference-Causing Equipment Regulations.

Cet appareil numerique de la classe B respecte les exigences du Reglement sur le materiel broilleur du Canada.

This device complies with Class B Limits of Industry Canada. Operation is subject to the following two conditions:

1. This device may not cause harmful interference, and
2. This device must accept any interference received, including interference that may cause undesired operation.

Cisco Aironet 2.4-GHz Access Points are certified to the requirements of RSS-210 for 2.4-GHz spread spectrum devices, and Cisco Aironet 54-Mbps, 5-GHz Access Points are certified to the requirements of RSS-210 for 5-GHz spread spectrum devices. The use of this device in a system operating either partially or completely outdoors may require the user to obtain a license for the system according to the Canadian regulations. For further information, contact your local Industry Canada office.

European Community, Switzerland, Norway, Iceland, and Liechtenstein

Autonomous Access Point Models:
- AIR-AP1242AG-E-K9
- AIR-AP1242G-E-K9

### Declaration of Conformity with Regard to the 1999/5/EC (R&TTE Directive)

This declaration is only valid for configurations (combinations of software, firmware, and hardware) provided and supported by Cisco Systems. The use of software or firmware not provided and supported by Cisco Systems may result in the equipment no longer being compliant with the regulatory requirements.

Appendix B      Declarations of Conformity and Regulatory Information

This device complies with the EMC requirements (EN 60601-1-2) of the Medical Directive 93/42/EEC. For 2.4 GHz radios, the following standards were applied:

- Radio: EN 300.328-1, EN 300.328-2
- EMC: EN 301.489-1, EN 301.489-17
- Safety: EN 60950

This equipment is intended to be used in all EU and EFTA countries. Outdoor use may be restricted to certain frequencies and/or may require a license for operation. For more details, contact Cisco Corporate Compliance.
For 54 Mbps, 5 GHz access points, the following standards were applied:

- **Radio:** EN 301.893
- **EMC:** EN 301.489-1, EN 301.489-17
- **Safety:** EN 60950

The following CE mark is affixed to the access point with a 2.4 GHz radio and a 54 Mbps, 5 GHz radio:

![CE mark]

### Declaration of Conformity for RF Exposure

The radio has been found to be compliant to the requirements set forth in CFR 47 Sections 2.1091, and 15.247 (b) (4) addressing RF Exposure from radio frequency devices as defined in Evaluating Compliance with FCC Guidelines for Human Exposure to Radio Frequency Electromagnetic Fields. The equipment should be installed more than 20 cm (7.9 in.) from your body or nearby persons.

The access point must be installed to maintain a minimum 20 cm (7.9 in.) co-located separation distance from other FCC approved indoor/outdoor antennas used with the access point. Any antennas or transmitters not approved by the FCC cannot be co-located with the access point. The access point’s co-located 2.4 GHz and 5 GHz integrated antennas support a minimum separation distance of 8 cm (3.2 in.) and are compliant with the applicable FCC RF exposure limit when transmitting simultaneously.

**Note**

Dual antennas used for diversity operation are not considered co-located.
Guidelines for Operating Cisco Aironet Access Points in Japan

This section provides guidelines for avoiding interference when operating Cisco Aironet access points in Japan. These guidelines are provided in both Japanese and English.

**Autonomous Access Point Models:**
- AIR-AP1242AG-J-K9
- AIR-AP1242G-P-K9

**Lightweight Access Point Models:**
- AIR-LAP1242AG-J-K9
- AIR-LAP1242G-P-K9

この機器の使用周波数帯では、電子レンジ等の産業・科学・医療用機器のほか工場の製造ライン等で使用されている移動体識別用の構内無線局（免許を要する無線局）及び特定小電力無線局（免許を要しない無線局）が使用されています。
1. この機器を使用する前に、近くで移動体識別用の構内無線局及び特定小電力無線局が運用されていないことを確認して下さい。
2. 万一、この機器から移動体識別用の構内無線局に対して電波干渉の事例が発生した場合には、速やかに使用周波数を変更するか又は電波の発射を停止したうえ、下記連絡先にご連絡頂き、混信回避のための処置等(例えば、パーティションの設置など)についてご相談して下さい。
3. その他、この機器から移動体識別用の特定小電力無線局に対して電波干渉の事例が発生した場合など何かお困りのことが起きたときは、次の連絡先へお問い合わせ下さい。

連絡先：03-6434-6500

**English Translation**

This equipment operates in the same frequency bandwidth as industrial, scientific, and medical devices such as microwave ovens and mobile object identification (RF-ID) systems (licensed premises radio stations and unlicensed specified low-power radio stations) used in factory production lines.

1. Before using this equipment, make sure that no premises radio stations or specified low-power radio stations of RF-ID are used in the vicinity.

2. If this equipment causes RF interference to a premises radio station of RF-ID, promptly change the frequency or stop using the device; contact the number below and ask for recommendations on avoiding radio interference, such as setting partitions.

3. If this equipment causes RF interference to a specified low-power radio station of RF-ID, contact the number below:

低功率電波輻射性電機管理辦法

第十二條 經型式認證合格之低功率射頻電機，非經許可，公司、商號或使用者均不得擅自變更頻率、加大功率或變更原設計之特性及功能。

第十四條 低功率射頻電機之使用不得影響飛航安全及干擾合法通信；經發現有干擾現象時，應立即停用，並改善至無干擾時方得繼續使用。

前項合法通信，指依電信法規定作業之無線電信。

低功率射頻電機須忍受合法通信或工業、科學及醫療用電波輻射性電機設備之干擾。

English Translation

Administrative Rules for Low-power Radio-Frequency Devices

Article 12
For those low-power radio-frequency devices that have already received a type-approval, companies, business units or users should not change its frequencies, increase its power or change its original features and functions.

Article 14
The operation of the low-power radio-frequency devices is subject to the conditions that no harmful interference is caused to aviation safety and authorized radio station; and if interference is caused, the user must stop operating the device immediately and can't re-operate it until the harmful interference is clear.

The authorized radio station means a radio-communication service operating in accordance with the Communication Act.

The operation of the low-power radio-frequency devices is subject to the interference caused by the operation of an authorized radio station, by another intentional or unintentional radiator, by industrial, scientific and medical (ISM) equipment, or by an incidental radiator.
Operation of Cisco Aironet Access Points in Brazil

Information on Antennas and Power Levels

The AIR-(L)AP1242AG-E-K9 is equipped with antenna connectors to allow the use of dedicated antennas for both the 2.4 GHz and the 5 GHz radio.

This Declaration of Conformity also covers the antennas listed in table 1 and table 2 as they were assessed in combination with the product against the essential requirements of the Directive 1999/5/EC. For each of the antennas, the tables list the maximum conducted output power setting in order to result in a total eirp level below the applicable limit. Any combination of output power and antenna resulting in an eirp level above the regulatory limit is illegal and is outside the scope of this declaration. Antennas not listed in the tables below are also outside the scope of this document.

## Typical indoor range (across open office environment)

- **802.11b**: 105 ft (32 m) @ 54 Mbps
- **802.11g**: 180 ft (55 m) @ 48 Mbps
- **802.11g**: 260 ft (79 m) @ 36 Mbps
- **802.11g**: 285 ft (87 m) @ 24 Mbps
- **802.11g**: 330 ft (100 m) @ 18 Mbps
- **802.11g**: 355 ft (108 m) @ 12 Mbps
- **802.11g**: 365 ft (111 m) @ 11 Mbps
- **802.11g**: 380 ft (116 m) @ 9 Mbps
- **802.11g**: 410 ft (125 m) @ 6 Mbps
- **802.11g**: 425 ft (130 m) @ 5.5 Mbps
- **802.11g**: 445 ft (136 m) @ 2 Mbps
- **802.11g**: 460 ft (140 m) @ 1 Mbps

### Notes
- Measured with a 2.2 dBi dipole antenna

## Typical outdoor range

- **802.11b**: 85 ft (26 m) @ 54 Mbps
- **802.11g**: 150 ft (46 m) @ 48 Mbps
- **802.11g**: 210 ft (64 m) @ 36 Mbps
- **802.11g**: 230 ft (70 m) @ 24 Mbps
- **802.11g**: 260 ft (79 m) @ 18 Mbps
- **802.11g**: 280 ft (85 m) @ 12 Mbps
- **802.11g**: 310 ft (94 m) @ 9 Mbps
- **802.11g**: 330 ft (100 m) @ 6 Mbps

### Notes
- Measured with 3.5 dBi Omni-directional antenna

## Compliance

The 1240 series access point complies with UL 2043 for products installed in a building’s environmental air handling spaces, such as above suspended ceilings.

### Caution

Only the fiber-optic power injector (AIR-PWRINJ-FIB) has been tested to UL 2043 for operation in a building’s environmental air space; no other power injectors or power modules have been tested to UL 2043 and they should not be placed in a building’s environmental air space, such as above suspended ceilings.

## Safety

Designed to meet:

- UL 60950
- CAN/CSA C22.2 No. 60950
- UL 2043
- EN 60950
- IEC 60950

APPENDIX D

Channels and Maximum Power Levels

For channel and maximum power level settings, refer to *Channels and Maximum Power Settings for Cisco Aironet Autonomous Access Points and Bridges* or the *Channels and Maximum Power Settings for Cisco Aironet Lightweight Access Points and Bridges* document available on the Cisco Wireless documentation page of Cisco.com.

To browse to the document, follow these steps:

**Step 1** Click this link to the Cisco Wireless documentation home page:

**Step 2** Click *Cisco Aironet 1240AG Series* listed under Access Points.

**Step 3** Click *Install and Upgrade Guides*.

**Step 4** Click *Channels and Maximum Power Settings for Cisco Aironet Autonomous Access Points and Bridges*. or *Channels and Maximum Power Settings for Cisco Aironet Lightweight Access Points and Bridges*. 
Console Cable Pinouts

This appendix identifies the pinouts for the serial console cable that connects to the access point’s serial console port. The appendix contains the following sections:

- Overview, page E-2
- Console Port Signals and Pinouts, page E-2
Overview

The access point requires a special serial cable that connects the access point serial console port (RJ-45 connector) to your PC’s COM port (DB-9 connector). This cable can be purchased from Cisco (part number AIR-CONCAB1200) or can be built using the pinouts in this appendix.

Console Port Signals and Pinouts

Use the console RJ-45 to DB-9 serial cable to connect the access point’s console port to the COM port of your PC running a terminal emulation program.

**Note**
Both the Ethernet and console ports use RJ-45 connectors. Be careful to avoid accidently connecting the serial cable to the Ethernet port connector.

**Note**
After completing your configuration changes, you must remove the serial console cable from the access point.

Table E-1 lists the signals and pinouts for the console RJ-45 to DB-9 serial cable.

**Table E-1  Signals and Pinouts for a Console RJ-45 to DB-9 Serial Cable**

3. RXD indicates receive data.
4. GND indicates ground
This section describes an optional procedure designed to prime or stage your lightweight access points in a convenient location rather than after they are installed in possibly difficult to reach locations. This process can be used when a DHCP server is not reachable by your deployed access point and it helps limit potential installation problems to primarily Ethernet and power areas.

Figure F-1 illustrates a typical priming configuration for your lightweight access points.

**Figure F-1**  Typical Lightweight Access Point Priming Configuration
Before deploying your lightweight access points to their final locations, follow these steps to prime your access points:

**Step 1**  
In a Layer 2 environment, where the lightweight access points are located on the same subnet as the controller, the access point communicates directly with the controller.

**Step 2**  
In a Layer 3 environment, ensure a DHCP server (typically on your switch) is enabled on the same subnet as your lightweight access points. The access points will receive its IP address and controller information using DHCP Option 43.

The lightweight access point must be able to find the IP address of the controller. This can be accomplished using DHCP, DNS, OTAP, or IP subnet broadcast. This guide describes the DHCP method to convey the controller IP address. For more information, refer to the “Configuring DHCP Option 43 for Lightweight Access Points” section on page G-1.

**Note**  
For a Layer 3 access point on a different subnet than the controller, ensure the route to the controller has destination UDP ports 12222 and 12223 open for LWAPP communications. Ensure that the routes to the primary, secondary, and tertiary controllers allow IP packet fragments.

**Step 3**  
Ensure that your controller is connected to a switch trunk port.

**Step 4**  
Configure the controller in LWAPP Layer 3 mode and ensure that its DS Port is connected to the switch. Use the CLI, web-browser interface, or Cisco WCS procedures as described in the appropriate controller guide.

a. In multi-controller environments, you can set one controller’s DS port to **Master** (you can use the `config network master-base disable` CLI command or you can use the controller GUI) so that new access points always associate with it. You can use the `show network config` CLI command to determine if the controller DS port is the master.

All access points associate to the master controller. From one location, you can configure access point settings, such as primary, secondary, and tertiary controllers. This allows you to redistribute your access points to other controllers on the network.

You can also use a Cisco WCS server to control, configure, and redistribute all your access points from a single location.

**Step 5**  
Apply power to the lightweight access points:

a. Connect your lightweight access points to untagged access ports on your POE capable switch. You can optionally use power modules or power injectors to power your access points.

b. After you power up the lightweight access point, it begins a power-up sequence that you can check by observing the access point LEDs. All LEDs blink sequentially back and forth, indicating that the access point is trying to find a controller.

**Note**  
If the lightweight access point remains in this mode for more than 5 minutes, the access point is unable to find the master controller. Check the connection between the access point and the controller and ensure they are on the same subnet.

c. If the lightweight access point shuts down (all LEDs off), check to ensure that sufficient power is available.
d. When the lightweight access point associates with the controller, if the access point code version differs from the controller code version, the access point downloads the operating system code from the controller. All the access point LEDs blink simultaneously during the download.

**Step 6**  
If the operating system download is successful, the lightweight access point reboots. Normal operation is indicated when the radio LED is blinking to indicate radio activity.

**Step 7**  
Use the controller CLI, controller GUI, or Cisco WCS to configure the lightweight access point with primary, secondary, and tertiary controller names.

**Step 8**  
If the lightweight access point is in a Controller Mobility Group, use the controller CLI, controller GUI, or Cisco WCS to configure the Controller Mobility Group name.

**Step 9**  
Use controller CLI, controller GUI, or Cisco WCS to configure the access point-specific 802.11a, 802.11b, and 802.11g network settings.

**Step 10**  
If the configuration priming was successful, the radio LED is blinking to indicate normal operation.

**Step 11**  
Repeat Steps 4 to 9 for each access point.

When you successfully complete the configuration priming of all your lightweight access points, ensure that the Master setting is disabled on your controller. Also you can begin deploying the access points to their final destinations.
Configuring DHCP Option 43 for Lightweight Access Points

This appendix describes the steps needed to configure DHCP Option 43 on a Windows 2003 Enterprise DHCP server, such as a Cisco Catalyst 3750 series switch, for use with Cisco Aironet lightweight access points. This appendix contains these sections:

- Overview, page G-2
- Configuring Option 43 for 1000 Series Access Points, page G-3
- Configuring Option 43 for 1100, 1130, 1200, 1240, and 1300 Series Lightweight Access Points, page G-4
Overview

This section contains a DHCP Option 43 configuration example on a Windows 2003 Enterprise DHCP server for use with Cisco Aironet lightweight access points. For other DHCP server implementations, consult their product documentation for configuring DHCP Option 43. In Option 43, you should use the IP address of the controller management interface.

---

**Note**

DHCP Option 43 is limited to one access point type per DHCP pool. You must configure a separate DHCP pool for each access point type.

Cisco Aironet 1000 and 1500 series access points use a comma-separated string format for DHCP Option 43. Other Cisco Aironet access points use the type-length-value (TLV) format for DHCP Option 43. DHCP servers must be programmed to return the option based on the access point’s DHCP Vendor Class Identifier (VCI) string (DHCP Option 60). The VCI strings for Cisco access points capable of operating in lightweight mode are listed in Table G-1:

**Table G-1 Lightweight Access Point VCI Strings**

<table>
<thead>
<tr>
<th>Access Point</th>
<th>Vendor Class Identifier (VCI)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Aironet 1000 series</td>
<td>Airespace AP1200</td>
</tr>
<tr>
<td>Cisco Aironet 1100 series</td>
<td>Cisco AP c1100</td>
</tr>
<tr>
<td>Cisco Aironet 1130 series</td>
<td>Cisco AP c1130</td>
</tr>
<tr>
<td>Cisco Aironet 1200 series</td>
<td>Cisco AP c1200</td>
</tr>
<tr>
<td>Cisco Aironet 1240 series</td>
<td>Cisco AP c1240</td>
</tr>
<tr>
<td>Cisco Aironet 1300 series</td>
<td>Cisco AP c1300</td>
</tr>
<tr>
<td>Cisco Aironet 1500 series</td>
<td>Cisco APLA P1510</td>
</tr>
</tbody>
</table>

The format of the TLV block for 1100, 1130, 1200, 1240, and 1300 series access points is listed below:

- Type: 0xf1 (decimal 241)
- Length: Number of controller IP addresses * 4
- Value: List of WLC management interfaces
Configuring Option 43 for 1000 Series Access Points

To configure DHCP Option 43 for Cisco 1000 series lightweight access points in the embedded Cisco IOS DHCP server, follow these steps:

**Step 1** Enter configuration mode at the Cisco IOS command line interface (CLI).

**Step 2** Create the DHCP pool, including the necessary parameters such as default router and name server. A DHCP scope example is as follows:

```
ip dhcp pool <pool name>
  network <IP Network> <Netmask>
  default-router <Default router>
  dns-server <DNS Server>
```

Where:
- `<pool name>` is the name of the DHCP pool, such as AP1000
- `<IP Network>` is the network IP address where the controller resides, such as 10.0.15.1
- `<Netmask>` is the subnet mask, such as 255.255.255.0
- `<Default router>` is the IP address of the default router, such as 10.0.0.1
- `<DNS Server>` is the IP address of the DNS server, such as 10.0.10.2

**Step 3** Add the option 60 line using the following syntax:

```
option 60 ascii "Airespace.AP1200"
```

The quotation marks must be included.

**Step 4** Add the option 43 line using the following syntax:

```
option 43 ascii "Comma Separated IP Address List"
```

For example, if you are configuring option 43 for Cisco 1000 series access points using the controller IP addresses 10.126.126.2 and 10.127.127.2, add the following line to the DHCP pool in the Cisco IOS CLI:

```
option 43 ascii "10.126.126.2,10.127.127.2"
```

The quotation marks must be included.
Configuring Option 43 for 1100, 1130, 1200, 1240, and 1300 Series Lightweight Access Points

To configure DHCP Option 43 for Cisco Aironet 1100, 1130, 1200, 1240, and 1300 series lightweight access points in the embedded Cisco IOS DHCP server, follow these steps:

**Step 1** Enter configuration mode at the Cisco IOS CLI.

**Step 2** Create the DHCP pool, including the necessary parameters such as default router and name server. A DHCP scope example is as follows:

```
ip dhcp pool <pool name>
  network <IP Network> <Netmask>
  default-router <Default router>
  dns-server <DNS Server>
```

Where:
- `<pool name>` is the name of the DHCP pool, such as AP1240
- `<IP Network>` is the network IP address where the controller resides, such as 10.0.15.1
- `<Netmask>` is the subnet mask, such as 255.255.255.0
- `<Default router>` is the IP address of the default router, such as 10.0.0.1
- `<DNS Server>` is the IP address of the DNS server, such as 10.0.10.2

**Step 3** Add the option 60 line using the following syntax:

```
option 60 ascii "VCI string"
```

For the `VCI string`, use the value from Table G-1. The quotation marks must be included.

**Step 4** Add the option 43 line using the following syntax:

```
option 43 hex <hex string>
```

The `hex string` is assembled by concatenating the TLV values shown below:

- **Type + Length + Value**
- **Type** is always `f1(hex)`. **Length** is the number of controller management IP addresses times 4 in hex. **Value** is the IP address of the controller listed sequentially in hex.

For example, suppose that there are two controllers with management interface IP addresses, 10.126.126.2 and 10.127.127.2. The type is `f1(hex)`. The length is `2 * 4 = 8 = 08 (hex)`. The IP addresses translate to `0a7e7e02` and `0a7f7f02`. Assembling the string then yields `f1080a7e7e02a7f7f02`. The resulting Cisco IOS command added to the DHCP scope is listed below:

```
option 43 hex f1080a7e7e02a7f7f02
```
GLOSSARY

802.3af
The IEEE standard that describes a mechanism for Power over Ethernet (PoE). The standard provides the capability to deliver both power and data over standard Ethernet cabling.

802.11
The IEEE standard that specifies carrier sense media access control and physical layer specifications for 1- and 2-megabit-per-second (Mbps) wireless LANs operating in the 2.4-GHz band.

802.11a
The IEEE standard that specifies carrier sense media access control and physical layer specifications for wireless LANs operating in the 5-GHz frequency band.

802.11b
The IEEE standard that specifies carrier sense media access control and physical layer specifications for 5.5- and 11-Mbps wireless LANs operating in the 2.4-GHz frequency band.

802.11g
The IEEE standard that specifies carrier sense media access control and physical layer specifications for 6, 9, 12, 18, 24, 36, 48, and 54 Mbps wireless LANs operating in the 2.4-GHz frequency band.

A

access point
A wireless LAN data transceiver that uses radio waves to connect a wired network with wireless stations.

ad hoc network
A wireless network composed of stations without Access Points.

antenna gain
The gain of an antenna is a measure of the antenna’s ability to direct or focus radio energy over a region of space. High gain antennas have a more focused radiation pattern in a specific direction.

associated
A station is configured properly to allow it to wirelessly communicate with an Access Point.

Autonomous access point
A fully featured standalone access point that does not require a Cisco Wireless LAN Controller to operate.
B

beacon A wireless LAN packet that signals the availability and presence of the wireless device. Beacon packets are sent by access points and base stations; however, client radio cards send beacons when operating in computer to computer (Ad Hoc) mode.

BOOTP Boot Protocol. A protocol used for the static assignment of IP addresses to devices on the network.

BPSK Binary phase shift keying is a modulation technique used by IEEE 802.11b-compliant wireless LANs for transmission at 1 Mbps.

broadcast packet A single data message (packet) sent to all addresses on the same subnet.

C

CCK Complementary Code Keying. A modulation technique used by IEEE 802.11b-compliant wireless LANs for transmission at 5.5 and 11 Mbps.

CCKM Cisco Centralized Key Management. Using CCKM, authenticated client devices can roam from one access point to another without any perceptible delay during reassociation. An access point on your network provides wireless domain services (WDS) and creates a cache of security credentials for CCKM-enabled client devices on the subnet. The WDS access point's cache of credentials dramatically reduces the time required for reassociation when a CCKM-enabled client device roams to a new access point.

cell The area of radio range or coverage in which the wireless devices can communicate with the base station. The size of the cell depends upon the speed of the transmission, the type of antenna used, and the physical environment, as well as other factors.

client A radio device that uses the services of an Access Point to communicate wirelessly with other devices on a local area network.

CSMA Carrier sense multiple access. A wireless LAN media access method specified by the IEEE 802.11 specification.

D

data rates The range of data transmission rates supported by a device. Data rates are measured in megabits per second (Mbps).

dBi A ratio of decibels to an isotropic antenna that is commonly used to measure antenna gain. The greater the dBi value, the higher the gain, and the more acute the angle of coverage.

DFS Dynamic Frequency Selection. In some regulatory domains, 5-GHz radios are required to use DFS to avoid interfering with radar signals.
| **DHCP** | Dynamic host configuration protocol. A protocol available with many operating systems that automatically issues IP addresses within a specified range to devices on the network. The device retains the assigned address for a specific administrator-defined period. |
| **dipole** | A type of low-gain (2.2-dBi) antenna consisting of two (often internal) elements. |
| **domain name** | The text name that refers to a grouping of networks or network resources based on organization-type or geography; for example: name.com—commercial; name.edu—educational; name.gov—government; ISPname.net—network provider (such as an ISP); name.ar—Argentina; name.au—Australia; and so on. |
| **DNS** | Domain Name System server. A server that translates text names into IP addresses. The server maintains a database of host alphanumeric names and their corresponding IP addresses. |
| **DSSS** | Direct sequence spread spectrum. A type of spread spectrum radio transmission that spreads its signal continuously over a wide frequency band. |

**E**

| **EAP** | Extensible Authentication Protocol. An optional IEEE 802.1x security feature ideal for organizations with a large user base and access to an EAP-enabled Remote Authentication Dial-In User Service (RADIUS) server. |
| **Ethernet** | The most widely used wired local area network. Ethernet uses carrier sense multiple access (CSMA) to allow computers to share a network and operates at 10, 100, or 1000 Mbps, depending on the physical layer used. |

**F**

| **file server** | A repository for files so that a local area network can share files, mail, and programs. |
| **firmware** | Software that is programmed on a memory chip. |

**G**

| **gateway** | A device that connects two otherwise incompatible networks together. |
| **GHz** | Gigahertz. One billion cycles per second. A unit of measure for frequency. |
IEEE Institute of Electrical and Electronic Engineers. A professional society serving electrical engineers through its publications, conferences, and standards development activities. The body responsible for the Ethernet 802.3 and wireless LAN 802.11 specifications.

infrastructure The wired Ethernet network.

IP Address The Internet Protocol (IP) address of a station.

IP subnet mask The number used to identify the IP subnetwork, indicating whether the IP address can be recognized on the LAN or if it must be reached through a gateway. This number is expressed in a form similar to an IP address; for example: 255.255.255.0.

isotropic An antenna that radiates its signal in a spherical pattern.

Lightweight access point An access point operating in the Cisco Centralized Wireless LAN Architecture with a Cisco Wireless LAN Controller.

Media Access Control address. A unique 48-bit number used in Ethernet data packets to identify an Ethernet device, such as an access point or your client adapter.

Multiple basic SSID. Each multiple basic SSID is assigned a unique MAC address. You use multiple BSSIDs to assign a unique DTIM setting for each SSID and to broadcast SSIDs in beacons (one SSID per beacon).

Any of several techniques for combining user information with a transmitter’s carrier signal.

The echoes created as a radio signal bounces off of physical objects.

A single data message (packet) sent to multiple addresses.
O

omni-directional  This typically refers to a primarily circular antenna radiation pattern.

OFDM  Orthogonal frequency division multiplex is a modulation technique used by IEEE 802.11a-compliant wireless LANs for transmission at 6, 9, 12, 18, 24, 36, 48, and 54 Mbps.

P

packet  A basic message unit for communication across a network. A packet usually includes routing information, data, and sometimes error detection information.

Q

QPSK  Quadruple phase shift keying is a modulation technique used by IEEE 802.11b-compliant wireless LANs for transmission at 2 Mbps.

R

range  A linear measure of the distance that a transmitter can send a signal.

receiver sensitivity  A measurement of the weakest signal a receiver can receive and still correctly translate it into data.

RF  Radio frequency. A generic term for radio-based technology.

roaming  A feature of some Access Points that allows users to move through a facility while maintaining an unbroken connection to the LAN.

RP-TNC  A connector type unique to Cisco Aironet radios and antennas. Part 15.203 of the FCC rules covering spread spectrum devices limits the types of antennas that may be used with transmission equipment. In compliance with this rule, Cisco Aironet, like all other wireless LAN providers, equips its radios and antennas with a unique connector to prevent attachment of non-approved antennas to radios.
**Glossary**

**S**

**spread spectrum**  
A radio transmission technology that spreads the user information over a much wider bandwidth than otherwise required in order to gain benefits such as improved interference tolerance and unlicensed operation.

**SSID**  
Service set identifier (also referred to as Radio Network Name). A unique identifier used to identify a radio network and which stations must use to be able to communicate with each other or to an access point. The SSID can be any alphanumeric entry up to a maximum of 32 characters.

**T**

**transmit power**  
The power level of radio transmission.
Glossary

**U**

**UNII**
Unlicensed National Information Infrastructure—regulations for UNII devices operating in the 5.15 to 5.35 GHz and 5.725 to 5.825 GHz frequency bands.

**UNII-1**
Regulations for UNII devices operating in the 5.15 to 5.25 GHz frequency band.

**UNII-2**
Regulations for UNII devices operating in the 5.25 to 5.35 GHz frequency band.

**UNII-3**
Regulations for UNII devices operating in the 5.725 to 5.825 GHz frequency band.

**unicast packet**
A single data message (packet) sent to a specific IP address.

**W**

**WDS**
Wireless Domain Services. An access point providing WDS on your wireless LAN maintains a cache of credentials for CCKM-capable client devices on your wireless LAN. When a CCKM-capable client roams from one access point to another, the WDS access point forwards the client’s credentials to the new access point with the multicast key. Only two packets pass between the client and the new access point, greatly shortening the reassociation time.

**WEP**
Wired Equivalent Privacy. An optional security mechanism defined within the 802.11 standard designed to make the link integrity of wireless devices equal to that of a cable.

**WLSE**
Wireless LAN Solutions Engine. The WLSE is a specialized appliance for managing Cisco Aironet wireless LAN infrastructures. It centrally identifies and configures access points in customer-defined groups and reports on throughput and client associations. WLSE’s centralized management capabilities are further enhanced with an integrated template-based configuration tool for added configuration ease and improved productivity.

**WNM**
Wireless Network Manager.

**workstation**
A computing device with an installed client adapter.

**WPA**
Wi-Fi Protected Access is a standards-based, interoperable security enhancement that strongly increases the level of data protection and access control for existing and future wireless LAN systems. It is derived from and will be forward-compatible with the upcoming IEEE 802.11i standard. WPA leverages TKIP (Temporal Key Integrity Protocol) for data protection and 802.1X for authenticated key management.
# INDEX

## A
- access point image 3-16
- antenna
  - connectors C-2

## B
- basic settings, checking 3-3

## C
- CLI
  - terminal emulator settings 3-20, 4-12
- configuring DHCP Option 43 G-2
- connectors C-1, C-2
- console port E-2
- controller discovery process 2-4

## D
- data rates C-2
- declarations of conformity B-1
- default, configuration, resetting 3-14
- deployment
  - access points 2-5
  - process 2-5
- DHCP Option 43 4-2, G-1
- DHCP pool G-2
- discovery process
  - DHCP server 2-4
  - DNS server 2-4
  - locally stored 2-4

## E
- extended temperature range 2-3, 2-4

## F
- FCC Declaration of Conformity B-2
- FCC Safety Compliance 2-2
- frequency range C-2

## G
- guidelines, installation 2-4

## I
- indicators 3-2, 4-3
- input power C-1
- installation guidelines 2-4

## K
- key features 1-3

## M
- MAC information 2-5
- Mode button 3-16
- modulation C-1

## O
- operating temperature C-1
### Index

#### P
- package contents 2-3
- password reset 3-14
- pinouts, serial cable E-2
- power
  - connecting 2-20
  - input C-1
  - output C-2
- priming access points F-1
- process, controller discovery 2-4

#### R
- range, radio C-3
- regulatory
  - information B-1
- reloading access point image 3-16
- RF exposure B-7

#### S
- serial
  - cable E-2
  - Cisco cable E-2
- size C-1
- status indicators C-1

#### T
- temperature
  - operating C-1
- terminal emulator 3-20, 4-12
- TFTP server 3-16
- troubleshooting 3-1, 4-1
- type-length-value (TLV) G-2

#### U
- unpacking 2-3

#### V
- vendor class identifier (VCI) G-2
- voltage range C-1

#### W
- warnings 2-2
- web site, Cisco Software Center 3-19, 4-10
- weight C-1
- WEP key 3-4
