Notes:

1. This is an open drain output that on the host board requires a 4.7kΩ to 10kΩ pull-up resistor to Vcc_Host.
2. This input is internally biased high with a 4.7kΩ to 10kΩ pull-up resistor to VccT.
3. Two-Wire Serial interface clock and data lines require an external pull-up resistor dependent on the capacitance load.
4. They must be pulled up with a 4.7kΩ to 10 kΩ resistor on the host board. MOD-ABS is grounded by the module to indicate the module is present.

2. Rp is the pull up resistor. Active bus termination may be used by the host in place of a pull up resistor. Pull ups can be connected to any one of several power supplies, however the host board design shall ensure that no module contact has voltage exceeding module $V_{ccT}/R + 0.5$ V nor requires the module to sink more than 3.0mA current.
3. These voltages are measured on the other side of the connector to the device under test.
4. Ci is the capacitance looking into the module SCL and SDA contacts.0
5. Cb is the total bus capacitance on the SCL or SDA bus.
