Possibly the last handheld scanner
you will ever need to buy

Putting Power into Your Hands

PowerScan™ 9600 features all the benefits of Datalogics class-leading handheld scanners, adding modular connectivity, enhanced wireless operation, and diagnostics capabilities to ensure many years of productivity. Regardless of your environment, this device is capable of reading 1D and 2D codes of any size and density, and even has the option for document handling and image capture.

The high-performance optics and internal computing power ensure lightning-fast scanning and real-time feedback to the operator on the in-built OLED display. Whether you are using a corded or wireless model you can rest assured that all codes, even when poorly printed or damaged, will be read with ease. Ultimately, this amazing device **delivers up to 20% more productivity** when compared to other scanners in the same category.

Ensuring Even Better Cost of Ownership

With growing emphasis on long term device performance, Datalogic has equipped several cost-saving features in the PowerScan 9600 range. Smart battery technology maximizes and optimizes charging efficiency, providing an indication of battery health. The cradle also includes wireless charging capability, eliminating the possibility of poor or no charging due to damaged or dirty contacts, the number one failure in traditional setups.

These new cradles even provide information on device health, enabling you to schedule predictive maintenance, thus avoiding any unplanned downtime because of unexpected failure.

Future Proof Your Connectivity

The PowerScan 9600 includes embedded connectivity for all of the major retail and industrial standard communications protocols. Industrial connectivity reduces the risk of communication failure, leading to typical **cost savings of up to 5,000€/year**. Utilizing a simple plug and play modular architecture, the interfaces are slotted into the device cradle or used as an accessory in the case of a wired scanner. Any future changes to your setup will only require a quick exchange of the communications module. Traditional methods using third party interfaces introduce potential weak points into the system, leading to longer setup procedures or even downtime.

On the contrary, with the PowerScan 9600 productivity downtime is no longer a problem, with typical **savings of up to 7,500€/year.***

Ease of installation, configuration, and maintenance shrink Total Cost of Ownership

Industrial and warehouse environments are typically harsh and prone to radio interference, affecting traditional WiFi or Bluetooth® communications. The PowerScan 9600 is equipped with Datalogic's popular STAR narrowband radio. With up to 16 scanners linked to a single cradle and long-range communication, you have total freedom to walk around large shop floors or warehouses with a completely reliable connection.

The bi-directional system ensures immediate feedback to the user, ensuring the highest productivity with no risk of errors. Choosing the PowerScan 9600, you will **lower maintenance requirements and reduce the TCO by up to 15%**.

* For a 50-device installation
