Installation and Service Guide

Covers Server Generation M3

February 09, 2016
THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If the equipment causes interference to radio or television reception, which can be determined by turning the equipment off and on, users are encouraged to try to correct the interference by using one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Modifications to this product not authorized by Cisco could void the FCC approval and negate your authority to operate the product.

<td>Installation for Cisco UCS Integration</td>
<td>Provides installation and upgrade procedures for installing the server into Unified Computing System (UCS) integration.</td>
</tr>
</tbody>
</table>
Audience

This guide is for experienced network administrators who configure and maintain Cisco servers.

Documentation Feedback

To provide technical feedback on this document, or to report an error or omission, please send your comments to ucs-docfeedback@external.cisco.com. We appreciate your feedback.

Conventions

This document uses the following conventions for notes, cautions, and safety warnings. Notes and cautions contain important information that you should know.

- **Note**
  Means *reader take note*. Notes contain helpful suggestions or references to material that are not covered in the publication.

- **Caution**
  Means *reader be careful*. Cautions contain information about something you might do that could result in equipment damage or loss of data.

Safety warnings appear throughout this guide in procedures that, if performed incorrectly, can cause physical injuries. A warning symbol precedes each warning statement.

- **Warning**
  **IMPORTANT SAFETY INSTRUCTIONS**
  This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

  **SAVE THESE INSTRUCTIONS**

Waarschuwing

**BELANGRIJKE VEILIGHEIDSINSTRUCTIES**

Dit waarschuwingssymbool betekent gevaar. U verkeert in een situatie die lichamelijk letsel kan veroorzaken. Voordat u aan enige apparatuur gaat werken, dient u zich bewust te zijn van de bij elektrische schakelingen betrokken risico's en dient u op de hoogte te zijn van de standaard praktijken om ongelukken te voorkomen. Gebruik het nummer van de verklaring onderaan de waarschuwing als u een vertaling van de waarschuwing die bij het apparaat wordt geleverd, wilt raadplegen.

**BEWAAR DEZE INSTRUCTIES**

Avvertenza IMPORTANTI ISTRUZIONI SULLA SICUREZZA

Questo simbolo di avvertenza indica un pericolo. La situazione potrebbe causare infortuni alle persone. Prima di intervenire su qualsiasi apparecchiatura, occorre essere al corrente dei pericoli relativi ai circuiti elettrici e conoscere le procedure standard per la prevenzione di incidenti. Utilizzare il numero di istruzione presente alla fine di ciascuna avvertenza per individuare le traduzioni delle avvertenze riportate in questo documento.

CONSERVARE QUESTE ISTRUZIONI

Advarsel VIKTIGE SIKKERHETSINSTRUKSJONER

Dette advarselssymbolet betyr fare. Du er i en situasjon som kan føre til skade på person. Før du begynner å arbeide med noe av utstyret, må du være oppmerksom på farene forbundet med elektriske kretser, og kjenne til standardprosedyrer for å forhindre ulykker. Bruk nummeret i slutten av hver advarsel for å finne oversettelsen i de oversatte sikkerhetsadvarslerne som fulgte med denne enheten.

Overview

This chapter provides an overview of the Cisco UCS C22 server features. This server is a part of the Cisco UCS C-Series rack-mount server family. It is a high-performance, 1RU (rack-unit) server. It is designed to operate in both standalone environments and as part of the Cisco Unified Computing System (UCS).

The illustrations in this chapter show an overview of external server features. Internal server features are illustrated in Figure 3-4 on page 3-9.

The server is orderable in two different versions, each with one of two different front panel/backplane configurations:

- Cisco UCS C22 M3, small form-factor (SFF) drives, with 8-drive backplane. Holds up to eight 2.5-inch hard drives or solid state drives.
- Cisco UCS C22 M3, large form factor (LFF) drives, with 4-drive backplane. Holds up to four 3.5-inch hard drives.

Figure 1-1 shows the front panel features of small form-factor drives version of the server.

<td>- One RS-232 serial port</td>
</tr>
<tr>
<td></td>
<td>- One VGA(^2) video connector</td>
</tr>
<tr>
<td></td>
<td>- Four USB(^3) 2.0 connectors</td>
</tr>
<tr>
<td></td>
<td>There are also two USB 2.0 ports on the front panel.</td>
</tr>
</tbody>
</table>
WoL | The 1-Gb Base-T Ethernet LAN ports support the wake-on-LAN (WoL) standard.
---|---
Power | One 450 W power supply or one 650W power supply. See also Power Specifications, page A-2.
---|---
ACPI | This server supports the advanced configuration and power interface (ACPI) 4.0 standard.
---|---
Cooling | Five fan modules for front-to-rear cooling.
---|---
PCIe I/O | Two horizontal PCIe expansion slots on risers. See Replacing a PCIe Card, page 3-34 for slot specifications.
---|---
Note | In a single-CPU configuration, only PCIe slot 1 is active.
---|---
InfiniBand | The bus slots in this server support the InfiniBand architecture.
---|---
Storage | Drives are installed into front-panel drive bays that provide hot-pluggable access. There are two versions of the server front panel and backplane:
- Small Form Factor drives—The server can hold up to eight 2.5 in. (63.5 mm) SAS or SATA hard drives or solid state drives.
- Large Form Factor—The server can hold up to four 3.5 in. (82.5 mm) SAS or SATA hard drives.
---|---
Internal USB support | The server has one internal USB 2.0 socket on the motherboard that you can use with a USB thumb drive for additional storage. The server can be ordered with an optional blank 8-GB Cisco USB Flash Drive pre-installed in the internal USB port.
---|---
Disk Management (RAID) | For a list of RAID controller options and required cables, see RAID Controller Considerations, page C-1.
---|---
RAID Backup | There is one mounting point inside the chassis that can be used for the SuperCap power module that can be used with an LSI MegaRAID-CV card.
---|---
Video | Matrox G200e video controller. Resolution up to 1920 x1200, 16bpp at 60 Hz. Up to 256 MB of video memory.

1. DIMM = dual inline memory module
2. VGA = video graphics array
3. USB = universal serial bus
4. PCIe = peripheral component interconnect express
5. SAS = serial attached SCSI
6. SATA = serial advanced technology attachment
7. RAID = redundant array of independent disks
CHAPTER 2

Installing the Server

This chapter describes how to install the server, and it includes the following sections:

- Unpacking and Inspecting the Server, page 2-2
- Preparing for Server Installation, page 2-3
- Installing the Server In a Rack, page 2-5
- Initial Server Setup, page 2-8
- NIC Modes and NIC Redundancy Settings, page 2-12
- System BIOS and Cisco IMC Firmware, page 2-13
- Updating the BIOS and Cisco IMC Firmware, page 2-13
- Service Headers and Jumpers, page 2-15

Note

Before you install, operate, or service a server, review the Regulatory Compliance and Safety Information for Cisco UCS C-Series Servers for important safety information.

Warning

IMPORTANT SAFETY INSTRUCTIONS

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

SAVE THESE INSTRUCTIONS
Unpacking and Inspecting the Server

**Caution**
When handling internal server components, wear an ESD strap and handle modules by the carrier edges only.

**Tip**
Keep the shipping container in case the server requires shipping in the future.

**Note**
The chassis is thoroughly inspected before shipment. If any damage occurred during transportation or any items are missing, contact your customer service representative immediately.

To inspect the shipment, follow these steps:

**Step 1** Remove the server from its cardboard container and save all packaging material.
**Step 2** Compare the shipment to the equipment list provided by your customer service representative and Figure 2-1. Verify that you have all items.
**Step 3** Check for damage and report any discrepancies or damage to your customer service representative. Have the following information ready:

- Invoice number of shipper (see the packing slip)
- Model and serial number of the damaged unit
- Description of damage
- Effect of damage on the installation

**Figure 2-1 Shipping Box Contents**

Preparing for Server Installation

This section provides information about preparing for server installation, and it includes the following topics:

- Installation Guidelines, page 2-3
- Rack Requirements, page 2-4
- Equipment Requirements, page 2-4
- Slide Rail Adjustment Range, page 2-4

Installation Guidelines

Warning To prevent the system from overheating, do not operate it in an area that exceeds the maximum recommended ambient temperature of: 40° C (104° F).
Statement 1047

Warning The plug-socket combination must be accessible at all times, because it serves as the main disconnecting device.
Statement 1019

Warning This product relies on the building’s installation for short-circuit (overcurrent) protection. Ensure that the protective device is rated not greater than: 250 V, 15 A.
Statement 1005

Warning Installation of the equipment must comply with local and national electrical codes.
Statement 1074

When you are installing a server, use the following guidelines:

- Plan your site configuration and prepare the site before installing the server. See the Cisco UCS Site Preparation Guide for the recommended site planning tasks.
- Ensure that there is adequate space around the server to allow for servicing the server and for adequate airflow. The airflow in this server is from front to back.
- Ensure that the air-conditioning meets the thermal requirements listed in the Server Specifications.
- Ensure that the cabinet or rack meets the requirements listed in the “Rack Requirements” section on page 2-4.
- Ensure that the site power meets the power requirements listed in the Server Specifications. If available, you can use an uninterruptible power supply (UPS) to protect against power failures.

Caution
Avoid UPS types that use ferroresonant technology. These UPS types can become unstable with systems such as the Cisco UCS, which can have substantial current draw fluctuations from fluctuating data traffic patterns.
Rack Requirements

This section provides the requirements for the standard open racks.

The rack must be of the following type:

- A standard 19-in. (48.3-cm) wide, four-post EIA rack, with mounting posts that conform to English universal hole spacing, per section 1 of ANSI/EIA-310-D-1992.
- The rack post holes can be square 0.38-inch (9.6 mm), round 0.28-inch (7.1 mm), #12-24 UNC, or #10-32 UNC when you use the supplied slide rails.
- The minimum vertical rack space per server must be one RU, equal to 1.75 in. (44.45 mm).

Equipment Requirements

The slide rails supplied by Cisco Systems for this server do not require tools for installation. The inner rails (mounting brackets) are pre-attached to the sides of the server.

Slide Rail Adjustment Range

The slide rails for this server have an adjustment range of 24 to 36 inches (610 to 914 mm).
Installing the Server In a Rack

This section describes how to install the server in a rack.

Warning

To prevent bodily injury when mounting or servicing this unit in a rack, you must take special precautions to ensure that the system remains stable. The following guidelines are provided to ensure your safety:

This unit should be mounted at the bottom of the rack if it is the only unit in the rack.
When mounting this unit in a partially filled rack, load the rack from the bottom to the top with the heaviest component at the bottom of the rack.
If the rack is provided with stabilizing devices, install the stabilizers before mounting or servicing the unit in the rack.

Statement 1006

To install the slide rails and the server into a rack, follow these steps:

Step 1

Open the front securing latch (see Figure 2-2). The end of the slide-rail assembly marked “FRONT” has a spring-loaded securing latch that must be open before you can insert the mounting pegs into the rack-post holes.

a. On the rear side of the securing-latch assembly, hold open the clip marked “PULL.”
b. Slide the spring-loaded securing latch away from the mounting pegs.
c. Release the clip marked “PULL” to lock the securing latch in the open position.

Figure 2-2  Front Securing Latch

<table>
<thead>
<tr>
<th>1 Clip marked “PULL” on rear of assembly</th>
<th>3 Spring-loaded securing latch on front of assembly</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 Front mounting pegs</td>
<td></td>
</tr>
</tbody>
</table>
Step 2  Install the slide rails onto the rack:

a. Position a slide-rail assembly inside the two left-side rack posts (see Figure 2-3).

   Use the “FRONT” and “REAR” markings on the slide-rail assembly to orient the assembly correctly with the front and rear rack posts.

b. Position the front mounting pegs so that they enter the desired front rack-post holes from the front.

   Note
   The mounting pegs that protrude through the rack-post holes are designed to fit round or square holes, or smaller #10-32 round holes when the mounting peg is compressed. If your rack has #10-32 rack-post holes, align the mounting pegs with the holes and then compress the spring-loaded pegs to expose the #10-32 inner peg.

c. Expand the length-adjustment bracket until the rear mounting pegs protrude through the desired holes in the rear rack post.

   Use your finger to hold the rear securing latch open when you insert the rear mounting pegs to their holes. When you release the latch, it wraps around the rack post and secures the slide-rail assembly.

Step 3  Insert the server into the slide rails:

   Note
   The inner rails are pre-attached to the sides of the server at the factory. You can order replacement inner rails if these are damaged or lost (Cisco PID UCSC-RAIL1-I).

a. Align the inner rails that are pre-attached to the server sides with the front ends of the empty slide rails.
b. Push the server into the slide rails until it stops at the internal stops.

c. Push in the plastic release clip on each inner rail (labeled PUSH), and then continue pushing the server into the rack until its front latches engage the rack posts.

**Step 4**

Attach the (optional) cable management arm (CMA) to the rear of the slide rails:

---

**Note**
The CMA is designed for mounting on either the right or left slide rails. These instructions describe an installation to the rear of the right slide rails, as viewed from the rear of server.

---

a. Slide the plastic clip on the inner CMA arm over the flange on the mounting bracket that attached to the side of the server. See Figure 2-4.

---

**Note**
Whether you are mounting the CMA to the left or right slide rails, be sure to orient the engraved marking, “UP” so that it is always on the upper side of the CMA. See Figure 2-4.

---

b. Slide the plastic clip on the outer CMA arm over the flange on the slide rail. See Figure 2-4.

c. Attach the CMA retaining bracket to the left slide rail. Slide the plastic clip on the bracket over the flange on the end of the left slide rail. See Figure 2-4.

---

---

**Step 5**

Continue with the “Initial Server Setup” section on page 2-8.
Initial Server Setup

Connecting and Powering On the Server (Standalone Mode)

Note

This section describes how to power on the server, assign an IP address, and connect to server management when using the server in standalone mode. To use the server in UCS integration, specific cabling and settings are required. See Appendix D, “Installation for Cisco UCS Integration”.

The server is shipped with these default settings:

- The NIC mode is Shared LOM EXT.
- Shared LOM EXT mode enables the 1-Gb Ethernet ports and the ports on any installed Cisco virtual interface card (VIC) to access the Cisco Integrated Management Interface (Cisco IMC). If you want to use the 10/100 dedicated management ports to access the Cisco IMC, you can connect to the server and change the NIC mode as described in Step 4 of the following procedure.
- The NIC redundancy is active-active. All Ethernet ports are utilized simultaneously.
- DHCP is enabled.
- Internet protocol version 4 (IPv4) is enabled.

Use the following procedure to perform initial setup of the server:

Step 1

Attach the supplied power cord to the power supplies in your server, and then attach the power cord to a grounded AC power outlet. See the Power Specifications, page A-2 for power specifications.

Wait for approximately two minutes to let the server boot in standby power during the first bootup.

You can verify power status by looking at the Power Status LED (see Figure 1-1 on page 1-1):

- Off—There is no AC power present in the server.
- Amber—The server is in standby power mode. Power is supplied only to the Cisco IMC and some motherboard functions.
- Green—The server is in main power mode. Power is supplied to all server components.

Note

During bootup, the server beeps once for each USB device that is attached to the server. Even if there are no external USB devices attached, there is a short beep for each virtual USB device such as a virtual floppy drive, CD/DVD drive, keyboard, or mouse. A beep is also emitted if a USB device is hot-plugged or hot-unplugged during BIOS power-on self test (POST), or while you are accessing the BIOS Setup utility or the EFI shell.

Step 2

Connect a USB keyboard and VGA monitor to the server.
Step 3  Open the Cisco IMC Configuration Utility:

  a.  Press the **Power** button to boot the server. Watch for the prompt to press F8.

  b.  During bootup, press *F8* when prompted to open the Cisco IMC Configuration Utility. Note the differences between versions of Cisco IMC firmware:

    - In Cisco IMC 2.0(1) and later, there are two windows for this utility that you can switch between by pressing F1 or F2 (see Figure 2-5 for sample windows). The IPv4 and IPv6 protocols and dynamic domain name system (DDNS) are supported. You can also define a host name and a DDNS domain.

    - In Cisco IMC earlier than release 2.0(1), there is only one window for this utility. Only the IPv4 protocol is supported. DDNS is not supported.

*Figure 2-5  Cisco IMC Configuration Utility Window 1 and Window 2 (Cisco IMC 2.0(1) and Later)*

Step 4  Set NIC mode and NIC redundancy:

  a.  Set the NIC mode to your choice for which ports to use to access the Cisco IMC for server management (see Figure 1-3 on page 1-3 for identification of the ports):

    - **Shared LOM EXT (default)—**This is shared LOM extended mode. This is the factory-default setting, along with Active-active NIC redundancy and DHCP-enabled. With this mode, the shared LOM and Cisco Card interfaces are both enabled. In this mode, DHCP replies are returned to both the shared LOM ports and the Cisco card ports. If the system determines that the Cisco card connection is not getting its IP address from a Cisco UCS Manager system because the server is in standalone mode, further DHCP requests from the Cisco card are disabled. Use the Cisco Card NIC mode if you want to connect to the Cisco IMC through a Cisco card in standalone mode.

    - **Dedicated—**The dedicated management port is used to access the Cisco IMC. You must select a NIC redundancy and IP setting.

    - **Shared LOM—**The 1-Gb Ethernet ports are used to access the Cisco IMC. You must select a NIC redundancy and IP setting.

    - **Cisco Card—**The ports on an installed Cisco UCS virtual interface card (VIC) are used to access the Cisco IMC. You must select a NIC redundancy and IP setting.

  Note  The Cisco Card NIC mode is currently supported only with a Cisco UCS VIC that is installed in PCIe slot 1. See also Special Considerations for Cisco UCS Virtual Interface Cards, page 3-36.
b. Use this utility to change the NIC redundancy to your preference. This server has three possible NIC redundancy settings:
   - None—The Ethernet ports operate independently and do not fail over if there is a problem.
   - Active-standby—If an active Ethernet port fails, traffic fails over to a standby port.
   - Active-active—All Ethernet ports are utilized simultaneously. See NIC Modes and NIC Redundancy Settings, page 2-12 for more information.

Step 5 Choose whether to enable DHCP for dynamic network settings, or to enter static network settings.

Note Before you enable DHCP, your DHCP server must be preconfigured with the range of MAC addresses for this server. The MAC address is printed on a label on the rear of the server. This server has a range of six MAC addresses assigned to the Cisco IMC. The MAC address printed on the label is the beginning of the range of six contiguous MAC addresses.

Note In Cisco IMC 2.0(1) and later, you can choose whether to use IPv4 or IPv6 IP addresses by checking either the IPv4 or IPv6 check box.

The static IPv4 and IPv6 settings include:
   - The Cisco IMC IP address.
   - The prefix/subnet.
     For IPv6, valid values are 1–127.
   - The gateway.
     For IPv6, if you do not know the gateway, you can set it as none by typing :: (two colons).
   - The preferred DNS server address.
     For IPv6, you can set this as none by typing :: (two colons).

Step 6 Optional: Use this utility to make VLAN settings.

Step 7 Continue with the next action based on which release of Cisco IMC your server is running:
   - Cisco IMC earlier than release 2.0(1)—Skip to Step 14.
   - Cisco IMC 2.0(1) and later—Press F1 to go to the second settings window, then continue with the next step. From the second window, you can press F2 to switch back to the first window.

Step 8 Optional: Set a host name for the server.

Step 9 Optional: Enable dynamic DNS and set a dynamic DNS (DDNS) domain.

Step 10 Optional: If you select the Factory Default check box, the server will be set back to the factory defaults.

Step 11 Optional: Set a default user password.

Step 12 Optional: Enable auto-negotiation of port settings or set the port speed and duplex mode manually.

Note Auto-negotiation is applicable only when you use the Dedicated NIC mode. Auto-negotiation sets the port speed and duplex mode automatically based on the switch port to which the server is connected. If you disable auto-negotiation, you must set the port speed and duplex mode manually.

Step 13 Optional: Reset port profiles and the port name.
Step 14  Press F5 to refresh the settings you made. You might have to wait about 45 seconds until the new settings appear and the message, Network settings configured is displayed before you reboot the server in the next step.

Step 15  Press F10 to save your settings and reboot the server.

Note  If you chose to enable DHCP, the dynamically assigned IP and MAC addresses are displayed on the console screen during bootup.

Step 16  Connect to the Cisco IMC interface for server management. Connect Ethernet cables from your LAN to the server, using the ports that you selected by your NIC Mode setting in Step 4. The Active-active and Active-passive NIC redundancy settings require you to connect to two ports.

Step 17  Use a browser and the IP address of the Cisco IMC to connect to the Cisco IMC Setup Utility. The IP address is based upon the settings that you made in Step 4 (either a static address or the address assigned by your DHCP server).

Note  The default user name for the server is admin. The default password is password.

To manage the server, see the Cisco UCS C-Series Rack-Mount Server Configuration Guide or the Cisco UCS C-Series Rack-Mount Server CLI Configuration Guide for instructions on using those interfaces. The links to these documents are in the C-Series documentation roadmap:

NIC Modes and NIC Redundancy Settings

This server has the following NIC mode settings that you can choose from:

- **Shared LOM EXT (default)**—This is shared LOM extended mode. This is the factory default setting, along with Active-active NIC redundancy and DHCP-enabled. With this mode, the shared LOM and Cisco Card interfaces are both enabled.

  In this mode, DHCP replies are returned to both the shared LOM ports and the Cisco card ports. If the system determines that the Cisco card connection is not getting its IP address from a Cisco UCS Manager system because the server is in standalone mode, further DHCP requests from the Cisco card are disabled. If the system determines that the Cisco card connection is getting its IP address from a Cisco UCS Manager system, the reply has parameters that automatically move the server to UCSM mode.

- **Dedicated**—The dedicated management port is used to access the Cisco IMC. You must select a NIC redundancy and IP setting.

- **Shared LOM**—The 1-Gb Ethernet ports are used to access the Cisco IMC. You must select a NIC redundancy and IP setting.

- **Cisco Card**—The ports on an installed Cisco UCS virtual interface card (VIC) are used to access the Cisco IMC. You must select a NIC redundancy and IP setting.

  **Note**  
  The Cisco Card NIC mode is currently supported only with a Cisco UCS VIC that is installed in PCIe slot 1. See also Special Considerations for Cisco UCS Virtual Interface Cards, page 3-36.

This server has the following NIC redundancy settings that you can choose from:

- **None**—The Ethernet ports operate independently and do not fail over if there is a problem.

- **Active-standby**—If an active Ethernet port fails, traffic fails over to a standby port.

- **Active-active**—All Ethernet ports are utilized simultaneously.

  The active/active setting uses Mode 5 or Balance-TLB (adaptive transmit load balancing). This is channel bonding that does not require any special switch support. The outgoing traffic is distributed according to the current load (computed relative to the speed) on each slave. Incoming traffic is received by the current slave. If the receiving slave fails, another slave takes over the MAC address of the failed receiving slave.
System BIOS and Cisco IMC Firmware

This section includes information about the system BIOS and it includes the following sections:

- Updating the BIOS and Cisco IMC Firmware, page 2-13
- Accessing the System BIOS, page 2-14

Updating the BIOS and Cisco IMC Firmware

⚠️ Caution ⚠️

When you upgrade the BIOS firmware, you must also upgrade the Cisco IMC firmware to the same version or the server will not boot. Do not power off the server until the BIOS and Cisco IMC firmware are matching or the server will not boot.

Cisco provides the Cisco Host Upgrade Utility to assist with simultaneously upgrading the BIOS, Cisco IMC, and other firmware to compatible levels.

The server uses firmware obtained from and certified by Cisco. Cisco provides release notes with each firmware image. There are several methods for updating the firmware:

- **Recommended method**: Use the Cisco Host Upgrade Utility to simultaneously upgrade the Cisco IMC, BIOS, LOM, LSI storage controller, and Cisco UCS P81E VIC firmware to compatible levels.

  See the *Cisco Host Upgrade Utility Quick Reference Guide* for your firmware level at the documentation roadmap link below.

- **Note**: Your system firmware must be at minimum level 1.2 to use the Cisco Host Upgrade Utility. If your firmware is prior to level 1.2, you must use the methods below to update the BIOS and Cisco IMC firmware individually.

- You can upgrade the BIOS using the EFI interface, or upgrade from a Windows or Linux platform. See the *Cisco UCS C-Series Rack-Mount Server BIOS Upgrade Guide*.
- You can upgrade the Cisco IMC and BIOS firmware by using the Cisco IMC GUI interface. See the *Cisco UCS C-Series Rack-Mount Server Configuration Guide*.
- You can upgrade the Cisco IMC and BIOS firmware by using the Cisco IMC CLI interface. See the *Cisco UCS C-Series Rack-Mount Server CLI Configuration Guide*.

For links to the documents listed above, see the documentation roadmap at the following URL: http://www.cisco.com/go/unifiedcomputing/c-series-doc
Accessing the System BIOS

To change the BIOS settings for your server, follow these steps. Detailed instructions are also printed on the BIOS screens.

---

**Step 1** Enter the BIOS setup utility by pressing the **F2** key when prompted during bootup.

*Note* The version and build of the current BIOS are displayed on the Main page of the utility.

**Step 2** Use the arrow keys to select the BIOS menu page.

**Step 3** Highlight the field to be modified by using the arrow keys.

**Step 4** Press **Enter** to select the field that you want to change, and then modify the value in the field.

**Step 5** Press the right arrow key until the Exit menu screen is displayed.

**Step 6** Follow the instructions on the Exit menu screen to save your changes and exit the setup utility (or Press **F10**). You can exit without saving changes by pressing **Esc**.
Service Headers and Jumpers

This section includes the following topics:

- Header Location on the Motherboard, page 2-15
- Using the BIOS Recovery Header CN34, page 2-16

Header Location on the Motherboard

See Figure 2-6. The header is shown in red on the motherboard, with PCIe riser 2 removed. The header pins are shown in the magnified view.

Figure 2-6  Service Header Locations

<table>
<thead>
<tr>
<th>1</th>
<th>CN34 BIOS Recovery</th>
<th>2</th>
</tr>
</thead>
</table>
Using the BIOS Recovery Header CN34

Depending on which stage the BIOS becomes corrupted, you might see different behavior.

- If the BIOS BootBlock is corrupted, you might see the system get stuck on the following message:

  Initializing and configuring memory/hardware

- If it is a non-BootBlock corruption, the following message is displayed:

  ****BIOS FLASH IMAGE CORRUPTED****
  Flash a valid BIOS capsule file using Cisco IMC WebGUI or CLI interface.
  IF Cisco IMC INTERFACE IS NOT AVAILABLE, FOLLOW THE STEPS MENTIONED BELOW.
  1. Connect the USB stick with recovery.cap file in root folder.
  2. Reset the host.
  IF THESE STEPS DO NOT RECOVER THE BIOS
  1. Power off the system.
  2. Mount recovery jumper.
  3. Connect the USB stick with recovery.cap file in root folder.
  4. Power on the system.
  Wait for a few seconds if already plugged in the USB stick.
  REFER TO SYSTEM MANUAL FOR ANY ISSUES.

**Note**
As indicated by the message shown above, there are two procedures for recovering the BIOS. Try procedure 1 first, then if that does not recover the BIOS, use procedure 2.

**Note**
The server must have Cisco IMC version 1.4(6) or later to use these procedures.

Procedure 1: Reboot With recovery.cap File

**Step 1**  Download the BIOS update package and extract it to a temporary location.

**Step 2**  Copy the contents of the extracted recovery folder to the root directory a USB thumb drive. The recovery folder contains the recovery.cap file that is required in this procedure.

**Note**  The recovery.cap file must be in the root directory of the USB thumb drive. Do not rename this file. The USB thumb drive must be formatted with either FAT16 or FAT32 file systems.

**Step 3**  Insert the USB thumb drive into a USB port on the server.

**Step 4**  Reboot the server.

**Step 5**  Return the server to main power mode by pressing the Power button on the front panel.

The server boots with the updated BIOS boot block. When the BIOS detects a valid recovery.cap file on the USB thumb drive, it displays this message:

  Found a valid recovery file...Transferring to Cisco IMC
  System would flash the BIOS image now...
  System would restart with recovered image after a few seconds...

**Step 6**  Wait for server to complete the BIOS update, then remove the USB thumb drive from the server.
Note

During the BIOS update, the Cisco IMC will shut down the server and the screen will be blank for about 10 minutes. Do not unplug the power cords during this update. The Cisco IMC will power on the server after the update is complete.
Procedure 2: Use Recovery Jumper and recovery.cap File

See Figure 2-6 for the location of the CN34 header.

Step 1  Download the BIOS update package and extract it to a temporary location.

Step 2  Copy the contents of the extracted recovery folder to the root directory a USB thumb drive. The recovery folder contains the recovery.cap file that is required in this procedure.

Note  The recovery.cap file must be in the root directory of the USB thumb drive. Do not rename this file. The USB thumb drive must be formatted with either FAT16 or FAT32 file systems.

Step 3  Power off the server as described in Shutting Down and Powering Off the Server, page 3-6.

Step 4  Disconnect all power cords from the power supplies.

Step 5  Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

Caution  If you cannot safely view and access the component, remove the server from the rack.

Step 6  Remove the top cover as described in Removing and Replacing the Server Top Cover, page 3-7.

Step 7  Move the shorting jumper to pins 2 and 3 of the CN34 header (see Figure 2-6).

Step 8  Reconnect AC power cords to the server. The server powers up to standby power mode.

Step 9  Insert the USB thumb drive that you prepared in Step 2 into a USB port on the server.

Step 10  Return the server to main power mode by pressing the Power button on the front panel.

The server boots with the updated BIOS boot block. When the BIOS detects a valid recovery.cap file on the USB thumb drive, it displays this message:

```
Found a valid recovery file...Transferring to Cisco IMC
System would flash the BIOS image now...
System would restart with recovered image after a few seconds...
```

Step 11  Wait for server to complete the BIOS update, then remove the USB thumb drive from the server.

Note  During the BIOS update, the Cisco IMC will shut down the server and the screen will be blank for about 10 minutes. Do not unplug the power cords during this update. The Cisco IMC will power on the server after the update is complete.

Step 12  After the server has fully booted, power off the server again and disconnect all power cords.

Step 13  Move the jumper back to the default pins 1 and 2 of the J41 header.

Note  If you do not move the jumper, after recovery completion you see the prompt, Please remove the recovery jumper.

Step 14  Replace the top cover, replace the server in the rack, replace power cords and any other cables, then power on the server by pressing the Power button.
Maintaining the Server

This chapter describes how to diagnose server system problems using LEDs. It also provides information about how to install or replace hardware components, and it includes the following sections:

- Server Monitoring and Management Tools, page 3-1
- Status LEDs and Buttons, page 3-2
- Preparing for Server Component Installation, page 3-6
- Installing or Replacing Server Components, page 3-11

Server Monitoring and Management Tools

Cisco Integrated Management Interface (Cisco IMC)

You can monitor the server inventory, health, and system event logs by using the built-in Cisco Integrated Management Controller (Cisco IMC) GUI or CLI interfaces. See the user documentation for your firmware release at the following URL:

Server Configuration Utility

Cisco has also developed the Cisco UCS Server Configuration Utility for C-Series servers, which can aid and simplify the following tasks:

- Monitoring server inventory and health
- Diagnosing common server problems with diagnostic tools and logs
- Setting the BIOS booting order
- Configuring some RAID configurations
- Installing operating systems

You can download the ISO from Cisco.com. See the user documentation for your version of the utility at the following URL:

Status LEDs and Buttons

This section describes the location and meaning of LEDs and buttons and includes the following topics:

- Front Panel LEDs, page 3-2
- Rear Panel LEDs and Buttons, page 3-4

Front Panel LEDs

Figure 3-1 shows the front panel LEDs. Table 3-1 defines the LED states.

# Status LEDs and Buttons

## System status
- **Green**—The server is running in normal operating condition.
- **Green, blinking**—The server is performing system initialization and memory check.
- **Amber, steady**—The server is in a degraded operational state. For example:
  - Power supply redundancy is lost.
  - CPUs are mismatched.
  - At least one CPU is faulty.
  - At least one DIMM is faulty.
  - At least one drive in a RAID configuration failed.
- **Amber, blinking**—The server is in a critical fault state. For example:
  - Boot failed.
  - Fatal CPU and/or bus error is detected.
  - Server is in over-temperature condition.

## Fan status
- **Green**—All fan modules are operating properly.
- **Amber, steady**—One fan module has failed.
- **Amber, blinking**—Critical fault, two or more fan modules have failed.

## Temperature status
- **Green**—The server is operating at normal temperature.
- **Amber, steady**—One or more temperature sensors have exceeded a warning threshold.
- **Amber, blinking**—One or more temperature sensors have exceeded a critical threshold.

## Power supply status
- **Green**—All power supplies are operating normally.
- **Amber, steady**—One or more power supplies are in a degraded operational state.
- **Amber, blinking**—One or more power supplies are in a critical fault state.

## Network link activity
- **Off**—The Ethernet link is idle.
- **Green**—One or more Ethernet LOM ports are link-active, but there is no activity.
- **Green, blinking**—One or more Ethernet LOM ports are link-active, with activity.

## Hard drive fault
- **Off**—The hard drive is operating properly.
- **Amber**—This hard drive has failed.
- **Amber, blinking**—The device is rebuilding.

## Hard drive activity
- **Off**—There is no hard drive in the hard drive sled (no access, no fault).
- **Green**—The hard drive is ready.
- **Green, blinking**—The hard drive is reading or writing data.
Rear Panel LEDs and Buttons

Figure 3-2 shows the rear panel LEDs and buttons. Table 3-2 defines the LED states.

Preparing for Server Component Installation

This section describes how to prepare for component installation, and it includes the following topics:

- Required Equipment, page 3-6
- Shutting Down and Powering Off the Server, page 3-6
- Removing and Replacing the Server Top Cover, page 3-7
- Removing and Replacing the Front Chassis Panel, page 3-8
- Replaceable Component Locations, page 3-9
- Serial Number Location, page 3-9

Required Equipment

The following equipment is used to perform the procedures in this chapter:

- Number 2 Phillips-head screwdriver
- Electrostatic discharge (ESD) strap or other grounding equipment such as a grounded mat

Shutting Down and Powering Off the Server

The server can run in two power modes:

- Main power mode—Power is supplied to all server components and any operating system on your drives can run.
- Standby power mode—Power is supplied only to the service processor and the cooling fans and it is safe to power off the server (remove power cords) from this mode.

You can invoke a graceful shutdown or an hard shutdown by using either of the following methods:

- Use the Cisco IMC management interface.
- Use the Power button on the server front panel. To use the Power button, follow these steps:

  **Step 1** Check the color of the Power Status LED (see the “Front Panel LEDs” section on page 3-2).

  - Green—the server is in main power mode and must be shut down before it can be safely powered off. Go to Step 2.
  - Amber—the server is already in standby mode and can be safely powered off. Go to Step 3.

  **Step 2** Invoke either a graceful shutdown or a hard shutdown:

  **Caution** To avoid data loss or damage to your operating system, you should always invoke a graceful shutdown of the operating system.

  - Graceful shutdown—Press and release the Power button. The operating system performs a graceful shutdown and the server goes to standby mode, which is indicated by an amber Power Status LED.
  - Emergency shutdown—Press and hold the Power button for 4 seconds to force the main power off and immediately enter standby mode.

  **Step 3** Disconnect the power cords from the power supplies in your server to completely power off the server.
Removing and Replacing the Server Top Cover

To remove or replace the top cover of the server, follow these steps:

**Tip**
You do not have to remove the cover to replace hard drives or the power supply.

**Step 1**
Remove the top cover (see Figure 3-3):

a. Loosen the captive thumbscrew screw that secures the rear edge of the cover to the chassis.
b. Push the cover toward the server rear about one-half inch (1.27 cm), until it stops.
c. Lift the cover straight up from the server and set it aside.

**Step 2**
Replace the top cover:

a. Place the cover on top of the server about one-half inch (1.27 cm) behind the lip of the front chassis panel. The cover should sit flat.

**Note**
The flanges on the top cover must slide underneath the front chassis panel.

b. Slide the top cover toward the front chassis panel, sliding the flanges on the top cover underneath the front chassis panel.
c. Tighten the captive thumbscrew that secures the rear edge of the cover to the chassis.

</tr>
<tr>
<td>4</td>
<td>Top cover</td>
</tr>
<tr>
<td>5</td>
<td>Top cover thumbscrew</td>
</tr>
</tbody>
</table>
Removing and Replacing the Front Chassis Panel

To remove or replace the front chassis panel of the server, follow these steps:

**Tip**
Remove this panel only if you are instructed to do so in a procedure in this book.

---

**Step 1**
Remove the front chassis panel (see Figure 3-3):

a. Remove the top cover from the server as described in **Removing and Replacing the Server Top Cover, page 3-7.**

**Note**
If you have a newer version of the server, the front chassis panel has no screws but instead lifts off after the top cover is removed. If you have an older version of the server that has screws on the front chassis panel, continue with the following steps.

b. Use a #2 Phillips-head screwdriver to remove the two screws that secure the front chassis panel to the chassis (see Figure 3-3).

c. Push the panel toward the server rear about one-half inch (1.27 cm), until its front flanges are free from the front panel lip.

d. Lift the panel straight up from the server and set it aside.

---

**Step 2**
Replace the front chassis panel:

a. Set the front chassis panel back in place, about one-half inch (1.27 cm) behind the front panel lip.

**Note**
The flanges on the panel must slide under the front chassis lip.

b. Slide the front chassis panel toward the front chassis lip, sliding the flanges on the panel underneath the front chassis lip.

**Note**
If you have a newer version of the server, the front chassis panel has no screws but is instead held in place by spring-clips. If you have an older version of the server that has screws on the front chassis panel, continue with the following steps.

c. Replace the two screws that secure the panel to the chassis (see Figure 3-3).

d. Replace the top cover to the server as described in **Removing and Replacing the Server Top Cover, page 3-7.**
Replaceable Component Locations

This section shows the locations of the components that are discussed in this chapter. The view in Figure 3-4 is from the top down with the top cover, front chassis panel, and air baffle removed.

**Figure 3-4 Replaceable Component Locations**

</tbody>
</table>

Serial Number Location

The serial number for the server is printed on a label on the top of the server, near the front.
Color-Coded Touch Points

This server has color-coded touch points that indicate thumbscrews and latches on replaceable and hot-swappable components.

- Hot-swappable components have green plastic touch points. This includes the power supplies. (Exceptions are the drive trays on the front panel, which are hot-swappable but not green).
- Some replaceable but non-hot-swappable components have light-blue plastic touch-points.
Installing or Replacing Server Components

**Warning**
Blank faceplates and cover panels serve three important functions: they prevent exposure to hazardous voltages and currents inside the chassis; they contain electromagnetic interference (EMI) that might disrupt other equipment; and they direct the flow of cooling air through the chassis. Do not operate the system unless all cards, faceplates, front covers, and rear covers are in place.

Statement 1029

**Warning**
Class 1 laser product.
Statement 1008

**Caution**
When handling server components, wear an ESD strap to avoid damage.

**Tip**
You can press the Identification button on the front panel or rear panel to turn on a flashing Identification LED on the front and rear panels of the server. This allows you to locate the specific server that you are servicing when you go to the opposite side of the rack. You can also activate these LEDs remotely by using the Cisco IMC interface. See the “Status LEDs and Buttons” section on page 3-2 for locations of these LEDs.

This section describes how to install and replace server components, and it includes the following topics:

- Replacing Hard Drives or Solid State Drives, page 3-12
- Replacing a Front Operations Panel Board, page 3-13
- Replacing a Drive Backplane, page 3-16
- Replacing Fan Modules, page 3-18
- Replacing DIMMs, page 3-19
- Replacing CPUs and Heatsinks, page 3-24
- Additional CPU-Related Parts To Order With RMA Replacement Motherboards, page 3-29
- Replacing the Motherboard RTC Battery, page 3-31
- Replacing a PCIe Riser, page 3-32
- Replacing a PCIe Card, page 3-34
- Replacing an Internal USB Flash Drive, page 3-39
- Replacing the SuperCap Power Module (RAID Backup Unit), page 3-41
- Installing a Trusted Platform Module, page 3-43
- Replacing a SCU Upgrade ROM Module, page 3-46
- Replacing a Software RAID Key Module, page 3-47
- Replacing Power Supplies, page 3-48
Replacing Hard Drives or Solid State Drives

This section includes the following information:

- Drive Population Guidelines, page 3-12
- Drive Replacement Procedure, page 3-12

Drive Population Guidelines

The server has two different drive backplane options:

- The Small Form Factor version can hold up to eight 2.5-inch drives.
- The Large Form Factor version can hold up to four 3.5-inch drives.

The drive-bay numbering is shown in Figure 3-5 and Figure 3-6.

Drive Replacement Procedure

To replace or install a hot-pluggable hard drive, follow these steps:

You do not have to shut down or power off the server to replace hard drives or solid state drives (SSDs) because they are hot-pluggable.

Step 1

Remove the drive that you are replacing or remove a blank drive tray from the bay:

a. Press the release button on the face of the drive tray. See Figure 3-7.

b. Grasp and open the ejector lever and then pull the drive tray out of the slot.
c. If you are replacing an existing drive, remove the four drive-tray screws that secure the drive to the tray and then lift the drive out of the tray.

**Step 2** Install a new drive:

a. Place a new drive in the empty drive tray and install the four drive-tray screws.
b. With the ejector lever on the drive tray open, insert the drive tray into the empty drive bay.
c. Push the tray into the slot until it touches the backplane, then close the ejector lever to lock the drive in place.

---

**Replacing a Front Operations Panel Board**

The front operations panel board contains the front panel LEDs, Power and Identification buttons, and the front USB ports.

To replace a front operations panel board, follow these steps:

**Step 1** Remove the front operations panel board that you are replacing. See Figure 3-9:

a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.
b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

---

**Caution** If you cannot safely view and access the component, remove the server from the rack.
c. Remove the top cover as described in “Removing and Replacing the Server Top Cover” section on page 3-7.

d. Remove the front chassis panel as described in Removing and Replacing the Front Chassis Panel, page 3-8.

e. Disconnect the two ribbon cables from the front operations panel board.

To disconnect the ribbon cables, open their hinged connectors.

f. Use a #2 Phillips-head screwdriver to remove the two screws that secure the board to the chassis.

g. Slide the board back from the front panel openings until the keyed slots on the front corners of the board can be lifted over the chassis pegs.

h. Lift the board up and off the pegs and remove it from the chassis.

Step 2 Replace a front operations panel board:

a. Set the board in place with the keyed slots in the front corners of the board over the two chassis pegs.

Note When you slide the board forward in the next step, be careful to align the LED light-pipes on the board with the openings in the server front panel.

b. Slide the board forward to lock the keyed slots onto the pegs.

c. Replace the two screws that secure the board to the chassis.

d. Reconnect the two ribbon cables to the board.

Open a hinged connector and insert the end of a ribbon cable squarely into the connector until it stops, and then close the hinged connector.

Note The side of the cable end that is colored blue should face upward.

e. Replace the front chassis panel.

f. Replace the top cover.

g. Replace the server in the rack, replace cables, and then power on the server by pressing the Power button.
Figure 3-8  Replacing the Front Operations Panel Board

1  Hinged ribbon-cable connectors (two)  
2  Securing screws (two)
Replacing a Drive Backplane

Note
The Small Form Factor (eight-drive) and Large Form Factor (four-drive) backplanes are factory-configurable options. When replacing a backplane, you must replace it only with the same version of the backplane.

To install or replace a drive backplane, follow these steps:

Step 1
Remove the drive backplane that you are replacing. See Figure 3-9:

a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.

b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

Caution
If you cannot safely view and access the component, remove the server from the rack.

c. Remove the top cover as described in “Removing and Replacing the Server Top Cover” section on page 3-7.

d. Remove the front chassis panel as described in Removing and Replacing the Front Chassis Panel, page 3-8.

e. Remove all drives from the server.

Tip
Label the drives as you remove them to aid replacement.

f. Disconnect all cables from the backplane.

Tip
Label the cables as you disconnect them to aid replacement.

g. Disconnect the two ribbon cables from the front operations panel board and pull them out of the opening in the backplane assembly to provide clearance.

To disconnect the ribbon cables, open their hinged connectors.

h. Use a #2 Phillips-head screwdriver to remove the four screws that secure the backplane to the chassis (see Figure 3-9).

Note
Two of the backplane screws secure the backplane to the chassis floor; the other two securing screws are accessed from the outside of the server, one on each side.

i. Lift straight up on the backplane to disengage it from its guides on the chassis walls.

Step 2
Install a new drive backplane:

a. Set the backplane in place and then slide it down within the guides on the chassis walls until it sits on the chassis floor.

b. Replace the four screws that secure the backplane to the chassis (see Figure 3-9).
c. Thread the two front operation panel ribbon cables back through the opening in the backplane assembly.

d. Reconnect the two ribbon cables to the front operations panel board.

Open a hinged ribbon-cable connector and insert the end of a ribbon cable squarely into the connector until it stops, and then close the hinged connector.

Note The side of the ribbon cable end that is colored blue should face upward.

e. Reconnect all cables to the backplane, including all RAID controller cables and all power cables.

f. Replace all drives to the server.

g. Replace the front chassis panel.

h. Replace the top cover.

i. Replace the server in the rack, replace cables, and then power on the server by pressing the Power button.

**Figure 3-9 Replacing the Drive Backplane**

Replacing Fan Modules

The five fan modules in the server are numbered as follows when you are facing the front of the server (also see Figure 3-11). The fan numbering as designated by the server’s Cisco IMC software is also listed. For example, FAN 1 is designated as SYS_FAN2 in the software.

![Figure 3-10 Fan Module Numbering](image)

<table>
<thead>
<tr>
<th>FAN 1</th>
<th>FAN 2</th>
<th>FAN 3</th>
<th>FAN 4</th>
<th>FAN 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS_FAN2</td>
<td>SYS_FAN3</td>
<td>SYS_FAN4</td>
<td>SYS_FAN5</td>
<td>SYS_FAN6</td>
</tr>
</tbody>
</table>

To replace or install a fan module, follow these steps:

**Caution**

The fans in the Cisco UCS C22 server are *not* hot-swappable.

**Step 1**

Remove a fan module that you are replacing (see Figure 3-11):

a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.

b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

**Caution**

If you cannot safely view and access the component, remove the server from the rack.

c. Remove the top cover as described in “Removing and Replacing the Server Top Cover” section on page 3-7.

d. Remove the internal air baffle from the server to provide access to the fan-cable connectors on the motherboard.

e. Disconnect the fan module’s cable from its motherboard connector.

f. Grasp the fan module and lift straight up to free it from the chassis. Carefully free the fan module cable from the fan-tray clips to avoid damaging it.

**Step 2**

Install a new fan module:

a. Set the new fan module in place, aligning its four rubber pegs with the slots in the fan tray. See Figure 3-11.

b. Connect the fan’s cable to the motherboard connector. Reroute the cable into the cable clips on the fan tray.

c. Replace the air baffle and the top cover.

d. Replace the server in the rack.
Replacing DIMMs

This section includes the following topics:

- Memory Performance Guidelines and Population Rules, page 3-20
- DIMM Replacement Procedure, page 3-23

**Caution**

DIMMs and their sockets are fragile and must be handled with care to avoid damage during installation.

**Caution**

Cisco does not support 3rd-party DIMMs. Using non-Cisco DIMMs in the server might result in system problems or damage to the motherboard.

**Note**

To ensure the best server performance, it is important that you are familiar with memory performance guidelines and population rules before you install or replace memory.
Memory Performance Guidelines and Population Rules

This section describes the type of memory that the server requires and its effect on performance. The section includes the following topics:

- DIMM Slot Numbering, page 3-20
- DIMM Population Rules, page 3-21
- Memory Mirroring, page 3-22

DIMM Slot Numbering

Figure 3-12 shows the numbering of the DIMM slots.

*Figure 3-12  DIMM Slots and CPUs*
DIMM Population Rules

Observe the following guidelines when installing or replacing DIMMs:

- Each CPU supports three memory channels.
  - CPU1 supports channels A, B, and C.
  - CPU2 supports channels D, E, and F

**Note** In a single-CPU system, the maximum number of DIMMs is six (only the slots supported by CPU1).

- Each channel has two DIMM slots (for example, channel A = slots A1 and A2).
  - A channel can operate with one or two DIMMs installed.
  - If a channel has only one DIMM, populate slot 0 first (the blue slot).
- When both CPUs are installed, populate the DIMM slots of each CPU identically.
  - Fill blue slots in the channels first: A1, D1, B1, E1, C1, F1
  - Fill black slots in the channels second: A2, D2, B2, E2, C2, F2
- In a single-CPU configuration, populate the channels for CPU1 only. Any DIMM installed in a DIMM socket for which the CPU is absent is not recognized.
- Although 1600 MHz DIMMs can be run in Power Savings Mode (1.35 V operation), 1600 MHz operation is supported only when the DDR mode is set to Performance Mode (see “Enabling Low-Voltage DIMM Operation.”) A 1600 MHz DIMM set to Power Savings Mode operates at 1066 MHz.
- Observe the DIMM mixing rules shown in Table 3-3.

**Table 3-3 DIMM Mixing Rules**

<table>
<thead>
<tr>
<th>DIMM Parameter Mixed</th>
<th>Mix Within Single Channel?</th>
<th>Mix Across Multiple Channels?</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIMM size (4, 8, 16 GB)</td>
<td>Yes—can be different sizes in the channel.</td>
<td>Yes—Can be different sizes in server.</td>
</tr>
<tr>
<td>DIMM speed (1333 or 1600 MHz)</td>
<td>No—Must be same speed in channel.</td>
<td>No—Must be the same speed in server.</td>
</tr>
<tr>
<td>DIMM type (RDIMM, UDIMM)</td>
<td>No—Must be same type in channel.</td>
<td>No—Must be the same type in server.</td>
</tr>
</tbody>
</table>

- Memory mirroring reduces the amount of memory available by 50% because only one of the two populated channels provides data. When memory mirroring is enabled, DIMMs must be installed in sets of 2 or 4, as described in Memory Mirroring, page 3-22.
- Note the following restrictions when using UDIMMs. Even though a UDIMM might be rated at 1600 MHz, actual operational speeds are slower because of the Intel implementation.
  - In Performance Mode (1.5 V operation), UDIMMs run at 1333 MHz in 1 DPC configurations or at 1066 MHz in 2 DPC configurations.
  - In Power Saving Mode (1.35 V operation), UDIMMs run at 1333 MHz in 1 DPC configurations or at 1066 MHz in 2 DPC configurations.
Enabling Low-Voltage DIMM Operation

You can enable low voltage (1.35 V) DIMM operation for all DIMMs in the server. There is a setting in the BIOS Setup utility that you can use to change the DDR memory mode to Power Saving mode, as described in the following procedure:

**Step 1** Enter the BIOS setup utility by pressing the **F2** key when prompted during bootup.

**Step 2** Select the **Advanced** tab.

**Step 3** Select **Low Voltage DDR Mode**.

**Step 4** In the pop-up window, select either **Power Saving** or **Performance Mode**:

- **Power Saving Mode**–Prioritizes low-voltage memory operation.
- **Performance Mode**–Prioritizes performance memory operation. If you mix low-voltage DIMMs with standard DIMMs, the system defaults to this setting.

**Step 5** Press **F10** to save your changes and exit the setup utility.

Memory Mirroring

When memory mirroring is enabled, the memory subsystem simultaneously writes identical data to two channels. If a memory read from one of the channels returns incorrect data due to an uncorrectable memory error, the system automatically retrieves the data from the other channel. A transient or soft error in one channel does not affect the mirrored data, and operation continues unless there is a simultaneous error in exactly the same location on a DIMM and its mirrored DIMM. Memory mirroring reduces the amount of memory available to the operating system by 50% because only one of the two populated channels provides data.

If you choose to enable memory mirroring, population is different for single-CPU configurations and two-CPU configurations. Populate the DIMM slots in the order shown in either Table 3-4 or Table 3-5.

**Table 3-4** Memory Mirroring DIMM Population, Single-CPU

<table>
<thead>
<tr>
<th>Number of DIMMs per CPU</th>

</tr>
</tbody>
</table>
DIMM Replacement Procedure

To install a DIMM assembly, follow these steps:

**Step 1** Remove the DIMM that you are replacing:

a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.

b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

**Caution** If you cannot safely view and access the component, remove the server from the rack.

c. Remove the top cover as described in “Removing and Replacing the Server Top Cover” section on page 3-7.

d. Remove the internal air baffle from the server to provide access to the DIMM slots.

e. Open the ejector levers at both ends of the DIMM slot, then lift the DIMM out of the slot.

**Step 2** Install a new DIMM:

**Note** Before installing DIMMs, refer to the population guidelines. See Memory Performance Guidelines and Population Rules, page 3-20.

f. Align the new DIMM with the empty slot on the motherboard. Use the alignment key in the DIMM slot to correctly orient the DIMM.

g. Push down evenly on the top corners of the DIMM until it is fully seated and the ejector levers on both ends lock into place.

h. Replace the air baffle and the top cover.

i. Replace the server in the rack, replace cables, and then power on the server by pressing the Power button.
Replacing CPUs and Heatsinks

This server has two CPU sockets. Each CPU supports three DIMM channels (six DIMM slots). See Figure 3-12. This section includes the following topics:

- Special Information For Upgrades to Intel E5-2400 v2 Series CPUs, page 3-24
- Single-CPU Restrictions, page 3-25
- CPU Replacement Procedure, page 3-25
- Additional CPU-Related Parts To Order With RMA Replacement Motherboards, page 3-29

Special Information For Upgrades to Intel E5-2400 v2 Series CPUs

**Note**

Do not upgrade your Cisco UCS C22 server to Intel E5-2400 v2 Series CPUs if you use the server integrated under Cisco UCS Manager control. Cisco UCS C22 servers that have Intel E5-2400 v2 Series CPUs are not supported with Cisco UCS Manager integration at this time.

**Caution**

You must upgrade your server firmware to the required minimum level *before* you upgrade to Intel E5-2400 v2 Series CPUs. Older firmware versions cannot recognize the new CPUs and this results in a non-bootable server.

The minimum software and firmware versions required for the server to support Intel E5-2400 v2 Series CPUs are as follows:

<table>
<thead>
<tr>
<th>Software or Firmware</th>
<th>Minimum Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server Cisco IMC</td>
<td>1.5(5)</td>
</tr>
<tr>
<td>Server BIOS</td>
<td>1.5(5)</td>
</tr>
<tr>
<td>Cisco UCS Manager (UCSM-managed system only)</td>
<td>Not supported at this time.</td>
</tr>
</tbody>
</table>

**Do one of the following actions:**

- If your server’s firmware and/or Cisco UCS Manager software are already at the required levels shown in Table 3-6, you can replace the CPU hardware by using the procedure in this section.

- If your server’s firmware and/or Cisco UCS Manager software is earlier than the required levels, use the instructions in the Cisco UCS C-Series Servers Upgrade Guide for Intel E5-2600 v2 Series CPUs to upgrade your firmware. After you upgrade the software, return to the procedure in this section to replace the CPU and heatsink hardware.
Single-CPU Restrictions

The minimum configuration is that the server must have at least CPU1 installed. Install CPU1 first, then CPU2 (see Figure 3-12).

The following restrictions apply when using a single-CPU configuration:

- The maximum number of DIMMs is six (only the slots controlled by CPU1 are active).
- PCIe slot 2 is unavailable.

CPU Replacement Procedure

Warning CPUs and their motherboard sockets are fragile and must be handled with care to avoid damaging pins during installation. The CPUs must be installed with heatsinks and their thermal pads to ensure proper cooling. Failure to install a CPU correctly might result in damage to the server.

Warning The Pick-and-Place tools used in this procedure are required to prevent damage to the contact pins between the motherboard and the CPU. Do not attempt this procedure without the required tools, which are included with each CPU option kit. If you do not have the tool, you can order a spare (Cisco PID UCS-CPU-EN-PNP).

To install or replace a CPU heatsink and CPU, follow these steps:

**Step 1** Remove the CPU and heatsink that you are replacing:

- a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.
- b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

Caution If you cannot safely view and access the component, remove the server from the rack.

- c. Remove the top cover as described in “Removing and Replacing the Server Top Cover” section on page 3-7.
- d. Remove the internal air baffle from the server to provide access to the CPUs.
- e. Use a #2 Phillips-head screwdriver to loosen the four captive screws that secure the heatsink and then lift it off of the CPU.

Note Alternate loosening each screw evenly to avoid damaging the heatsink or CPU.

- f. Unclip the CPU retaining latch, then open the hinged CPU cover plate. See Figure 3-13.
Step 2  Remove a protective cap or an old CPU from the socket (if present):
- If you are removing an old CPU, skip to Step 3.
- If you are installing a new CPU to a socket that was shipped empty, the socket has a protective cap that is intended to prevent bent contact pins. Use the tool as shown in Figure 3-14 to grasp the protective cap and then pivot to remove the cap.

![Figure 3-13 CPU Socket Latches](image)

<table>
<thead>
<tr>

<td>CPU</td>
</tr>
<tr>
<td>3</td>
<td>CPU retaining latch</td>
<td>4</td>
<td></td>
</tr>
</tbody>
</table>

![Figure 3-14 Protective Cap Removal Tool](image)
Step 3  Remove an old CPU:
   a. Set the Pick-and-Place tool on the CPU in the socket, aligning the arrow on the tool with the registration mark on the socket (the small triangular mark). See Figure 3-15.
   b. Press the top button on the tool to grasp the installed CPU.
   c. Lift the tool and CPU straight up.
   d. Press the top button on the tool to release the old CPU on an anti-static surface.

Figure 3-15  Removing or Inserting a CPU

Step 4  Insert the new CPU into the Pick-and-Place tool:
   a. Remove the new CPU from the packaging and place it on the pedestal that is included in the kit. Align the registration mark on the corner of the CPU with the arrow on the corner of the pedestal (see Figure 3-16).
   b. Set the Pick-and-Place tool on the CPU pedestal, aligning the arrow on the tool with the arrow on the corner of the pedestal. Make sure that the tabs on the tool are fully seated in the slots on the pedestal.
   c. Press the top button on the tool to grasp and lock in the CPU.
   d. Lift the tool and CPU straight up off the pedestal.
Step 5  Install a new CPU:

a. Set the Pick-and-Place tool with CPU over the empty CPU socket on the motherboard.

Note  Align the arrow on the top of the tool with the registration mark (small triangle) that is stamped on the metal of the CPU socket, as shown in Figure 3-15.

b. Press the top button on the tool to set the CPU into the socket. Remove the empty tool.

c. Close the hinged CPU cover plate.

d. Clip down the CPU retaining latch. See Figure 3-13.

Step 6  Install a heatsink:

Caution  The heatsink must have a new, undamaged thermal pad on the heatsink-to-CPU surface to ensure proper cooling. If you are replacing a heatsink that was previously used, you must remove the old thermal pad. If you are installing a new heatsink, skip to step d. below.

a. Apply an alcohol-based cleaning solution to the old thermal pad and let it soak for a least 15 seconds.

b. Wipe all of the old thermal pad off the old heatsink using a soft cloth that will not scratch the heatsink surface.
c. Apply thermal grease from an included syringe to the top of the CPU.
   Apply about 2 cubic centimeters of grease (about half the syringe contents) to the top of the CPU in the pattern that is shown in Figure 3-17.

Note If you do not have a syringe of thermal grease, you can order a spare (Cisco PID UCS-CPU-GREASE).

![Figure 3-17 Thermal Grease Application Pattern]

d. For a new heatsink, peel the protective film from the thermal pad that is on the bottom of the new heatsink.

Note Do not apply a syringe of thermal grease if you are installing a new heatsink that already has a pre-applied thermal pad.

e. Align the heatsink captive screws with the motherboard standoffs, then use a Number 2 Phillips-head screwdriver to tighten the captive screws evenly.

Note Alternate tightening each screw evenly to avoid damaging the heatsink or CPU.

f. Replace the top cover.

g. Replace the server in the rack, replace cables, and then power on the server by pressing the Power button.

Additional CPU-Related Parts To Order With RMA Replacement Motherboards

When a return material authorization (RMA) of the motherboard or CPU is done on a Cisco UCS C-series server, there are additional parts that might not be included with the CPU or motherboard spare bill of materials (BOM). The TAC engineer might need to add the additional parts to the RMA to help ensure a successful replacement.

- Scenario 1—You are re-using the existing heatsinks:
- Heat sink cleaning kit (UCSX-HSCK=)
- Thermal grease kit for C22 (UCS-CPU-GREASE=)
- Intel CPU Pick-n-Place tool for EP CPUs (UCS-CPU-EN-PNP=)

- Scenario 2—You are replacing the existing heatsinks:
  - Heat sink (UCSC-HS-EN-M3=)
  - Heat sink cleaning kit (UCSX-HSCK=)
  - Intel CPU Pick-n-Place tool for EP CPUs (UCS-CPU-EN-PNP=)

A CPU heatsink cleaning kit is good for up to four CPU and heatsink cleanings. The cleaning kit contains two bottles of solution, one to clean the CPU and heat sink of old thermal interface material and the other to prepare the surface of the heatsink.

New heatsink spares have preinstalled thermal interface material covered by a small sheet of plastic. It is important to clean the old thermal interface material off of the CPU prior to installing the heatsinks. Therefore, when ordering new heatsinks it is still necessary to order the heatsink cleaning kit at a minimum.
Replacing the Motherboard RTC Battery

**Warning**

There is danger of explosion if the battery is replaced incorrectly. Replace the battery only with the same or equivalent type recommended by the manufacturer. Dispose of used batteries according to the manufacturer’s instructions. [Statement 1015]

The real-time clock (RTC) battery retains system settings when the server is disconnected from power. The battery type is CR2032. Cisco supports the industry-standard CR2032 battery, which can be purchased from most electronic stores.

To replace or install the motherboard RTC battery, follow these steps:

**Step 1**

Remove the RTC battery (see Figure 3-18):

a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.

b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

**Caution**

If you cannot safely view and access the component, remove the server from the rack.

c. Remove the top cover as described in “Removing and Replacing the Server Top Cover” section on page 3-7.

d. Locate the RTC battery. See Figure 3-18.

e. Gently remove the battery from the holder on the motherboard. Pull the retaining clip in the battery holder away from the battery to provide clearance.

**Step 2**

Install an RTC battery:

a. Gently insert the battery into the holder and inside the retaining clip.

**Note**

The positive side of the battery marked “3V+” should face upward.

b. Push the battery into the socket until it is fully seated.

c. Replace the top cover.

d. Replace the server in the rack, replace cables, and power on the server by pressing the **Power** button.
Replacing a PCIe Riser

The server contains two toolless PCIe risers for horizontal installation of PCIe cards. See Table 3-7 for a description of the PCIe slots on each riser.

**Note**

PCIe riser 2 (slots 2) is not available in single-CPU configurations.

To install or replace a PCIe riser, follow these steps:

**Step 1**

Remove the PCIe riser that you are replacing (see Figure 3-20):

a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.

b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

**Caution**

If you cannot safely view and access the component, remove the server from the rack.
c. Remove the top cover as described in “Removing and Replacing the Server Top Cover” section on page 3-7.

d. Lift straight up on both ends of the PCIe riser to disengage its circuit board from the socket on the motherboard.

e. If the riser has a card installed, remove the card from the riser.

**Step 2** Install a new PCIe riser:

a. If you removed a card from the old PCIe riser, install the card to the new riser (see Replacing a PCIe Card, page 3-34).

b. Position the PCIe riser over its socket on the motherboard and over the chassis alignment features (see Figure 3-20). The metal shell of the riser has alignment tabs that fit into slots in the chassis.

c. Carefully push down on both ends of the PCIe riser to fully engage its circuit board connector with the socket on the motherboard.

d. Replace the top cover.

e. Replace the server in the rack, replace cables, and then power on the server by pressing the **Power** button.

**Figure 3-20** Replacing the PCIe Riser

Replacing a PCIe Card

Caution
Cisco supports all PCIe cards qualified and sold by Cisco. PCIe cards not qualified or sold by Cisco are the responsibility of the customer. Although Cisco will always stand behind and support the C-Series rack-mount servers, customers using standard, off-the-shelf, third-party cards must go to the third-party card vendor for support if any issue with that particular third-party card occurs.

This section includes the following topics:
- PCIe Slots, page 3-34
- RAID Card Firmware Compatibility, page 3-35
- Replacing a PCIe Card, page 3-35
- Special Considerations for Cisco UCS Virtual Interface Cards, page 3-36
- Installing Multiple PCIe Cards and Resolving Limited Resources, page 3-37

PCIe Slots

The server contains two toolless PCIe risers for horizontal installation of PCIe cards. See Figure 3-21 and Table 3-7 for a description of the PCIe slots on these risers.

Note
In a single-CPU system, PCIe riser 2 (slot 2) is not available.

Figure 3-21 Rear Panel, Showing PCIe Slots

Table 3-7 PCIe Expansion Slots

<table>
<thead>
<tr>
<th>Slot Number</th>
<th>Electrical Lane Width</th>
<th>Connector Length</th>
<th>Card Length</th>
<th>Card Height</th>
<th>NCSI Support</th>
</tr>
</thead>

<tr>
<td>2 (on riser 2)</td>
<td>Gen-3 x16</td>
<td>x16 connector</td>
<td>1/2 length</td>
<td>1/2 height</td>
<td>No</td>
</tr>
</tbody>
</table>

1. This is the supported length because of internal clearance.
2. This is the size of the rear panel opening.
3. Network Communications Services Interface protocol
4. Slot 1 can operate when the server is in standby power mode.

Note
In single-CPU configurations, only PCIe slot 1 can be used.
RAID Card Firmware Compatibility

If the PCIe card that you are installing is a RAID controller card, firmware on the RAID controller must be verified for compatibility with the current Cisco IMC and BIOS versions that are installed on the server. If not compatible, upgrade or downgrade the RAID controller firmware accordingly using the Host Upgrade Utility (HUU) for your firmware release to bring it to a compatible level.

See the HUU guide for your Cisco IMC release for instructions on downloading and using the utility to bring server components to compatible levels: HUU Guides

Replacing a PCIe Card

Note
If you are installing a Cisco UCS Virtual Interface Card, there are prerequisite considerations. See Special Considerations for Cisco UCS Virtual Interface Cards, page 3-36.

Note
If you are installing a RAID controller card, see RAID Controller Considerations, page C-1 for more information about supported cards and cabling.

To install or replace a PCIe card, follow these steps:

Step 1
Remove a PCIe card (or a blank filler panel) from the PCIe riser:

a. Shut down and power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.

b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

Caution
If you cannot safely view and access the component, remove the server from the rack.

c. Remove the top cover as described in the “Removing and Replacing the Server Top Cover” section on page 3-7.

d. Remove any cables from the ports of the PCIe card that you are replacing.

Tip
Label the cables when you disconnect them to aid correct connection to the new card.

e. Lift straight up on both ends of the PCIe riser to disengage it from the socket on the motherboard.

f. Pull evenly on both ends of the PCIe card to remove it from the socket on the PCIe riser.

If the riser has no card, remove the blanking panel from the rear opening of the riser.

Step 2
Install a new PCIe card:

a. Align the new PCIe card with the empty socket on the PCIe riser.

Note
Align and insert the card’s rear panel tab into the riser’s rear panel opening at the same time you align the card with the empty socket.

b. Push down evenly on both ends of the card until it is fully seated in the socket.
c. Ensure that the card rear panel tab sits flat against the PCIe riser rear panel opening.

d. Position the PCIe riser over its socket on the motherboard and over the alignment features (see Figure 3-20).

e. Carefully push down on both ends of the PCIe riser to fully engage its circuit board connector with the socket on the motherboard.

f. Replace the top cover.

g. Replace the server in the rack, replace cables, then power on the server by pressing the Power button.

h. If the card that you replaced was a RAID controller, continue with Restoring RAID Configuration After Replacing a RAID Controller, page C-24.

---

**Special Considerations for Cisco UCS Virtual Interface Cards**

Table 3-8 describes the requirements for the supported Cisco UCS virtual interface cards (VICs).

**Table 3-8 Cisco UCS C22 Requirements for Virtual Interface Cards**

</table>

1. See PCIe Slots, page 3-34.
2. See note below.
3. The Cisco UCS VIC1225T is not supported for UCS integration at this time.

**Note**

The Cisco UCS VIC P81E is not supported in the C22 Large Form Factor version of the server.

---

**RAID Controller Card Cable Routing**

If the PCIe card that you are installing or replacing is a RAID controller card, see RAID Controller Considerations, page C-1 for required cables and cable routing guidelines.

See also Replacing the SuperCap Power Module (RAID Backup Unit), page 3-41 for instructions on installing a RAID backup unit for a RAID controller card.
Installing Multiple PCIe Cards and Resolving Limited Resources

When a large number of PCIe add-on cards are installed in the server, the system may run out of the following resources required for PCIe devices:

- Option ROM memory space
- 16-bit I/O space

The topics in this section provide guidelines for resolving the issues related to these limited resources.

- Resolving Insufficient Memory Space to Execute Option ROMs, page 3-37
- Resolving Insufficient 16-Bit I/O Space, page 3-38

Resolving Insufficient Memory Space to Execute Option ROMs

The system has very limited memory to execute PCIe legacy option ROMs, so when a large number of PCIe add-on cards are installed in the server, the system BIOS might not be able to execute all of the option ROMs. The system BIOS loads and executes the option ROMs in the order that the PCIe cards are enumerated (Slot 1, Slot 2, Slot 3, etc.).

If the system BIOS does not have sufficient memory space to load any PCIe option ROM, it skips loading that option ROM, reports a system event log (SEL) event to the Cisco IMC controller and reports the following error in the Error Manager page of the BIOS Setup utility:

<table>
<thead>
<tr>
<th>ERROR CODE</th>
<th>SEVERITY</th>
<th>INSTANCE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>146</td>
<td>Major</td>
<td>N/A</td>
<td>PCI out of resources error. Major severity requires user intervention but does not prevent system boot.</td>
</tr>
</tbody>
</table>

To resolve this issue, disable the Option ROMs that are not needed for system booting. The BIOS Setup Utility provides the setup options to enable or disable the Option ROMs at the PCIe slot level for the PCIe expansion slots and at the port level for the onboard NICs. These options can be found in the BIOS Setup Utility Advanced → PCI Configuration page.

- Guidelines for RAID controller booting:
  
  If the server is configured to boot primarily from RAID storage, make sure that the option ROMs for the slots where your RAID controllers installed are enabled in the BIOS, depending on your RAID controller configuration.

  If the RAID controller does not appear in the system boot order even with the option ROMs for those slots are enabled, the RAID controller option ROM might not have sufficient memory space to execute. In that case, disable other option ROMs that are not needed for the system configuration to free up some memory space for the RAID controller option ROM.

- Guidelines for onboard NIC PXE booting:

  If the system is configured to primarily perform PXE boot from onboard NICs, make sure that the option ROMs for the onboard NICs to be booted from are enabled in the BIOS Setup Utility. Disable other option ROMs that are not needed to create sufficient memory space for the onboard NICs.
Resolving Insufficient 16-Bit I/O Space

The system has only 64 KB of legacy 16-bit I/O resources available. This 64 KB of I/O space is divided between the CPUs in the system because the PCIe controller is integrated into the CPUs. This server BIOS has the capability to dynamically detect the 16-bit I/O resource requirement for each CPU and then balance the 16-bit I/O resource allocation between the CPUs accordingly during the PCI bus enumeration phase of the BIOS POST.

When a large number of PCIe cards are installed in the system, the system BIOS might not have sufficient I/O space for some PCIe devices. If the system BIOS is not able to allocate the required I/O resources for any PCIe devices, the following symptoms have been observed:

- The system might get stuck in an infinite reset loop.
- The BIOS might appear to hang while initializing PCIe devices.
- The PCIe option ROMs might take excessive time to complete, which appears to lock up the system.
- PCIe boot devices might not be accessible from the BIOS.
- PCIe option ROMs might report initialization errors. These errors are seen before the BIOS passes control to the operating system.
- The keyboard might not work.

To work around this problem, rebalance the 16-bit I/O load using the following methods:

1. Physically remove any unused PCIe cards.
2. If the system has one or more Cisco virtual interface cards (VICs) installed, disable the PXE boot on the VICs that are not required for the system boot configuration by using the Network Adapters page in the Cisco IMC WebUI to free up some 16-bit I/O resources. Each VIC uses a minimum 16 KB of 16-bit I/O resource, so disabling PXE boot on Cisco VICs would free up some 16-bit I/O resources that can be used for other PCIe cards that are installed in the system.
Replacing an Internal USB Flash Drive

The server has one internal USB 2.0 socket on the motherboard that you can use with a USB thumb drive for additional storage. The server can be ordered with an optional blank 8-GB Cisco USB Flash Drive pre-installed in the internal USB port.

This section includes the following topics:

- Internal USB Flash Drive Replacement Procedure, page 3-39
- Enabling or Disabling the Internal USB Port, page 3-40

Internal USB Flash Drive Replacement Procedure

To install or replace an internal USB flash drive, follow these steps:

**Step 1**
Remove the USB flash drive that you are replacing. See Figure 3-22:

a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.

b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

Caution
If you cannot safely view and access the component, remove the server from the rack.

c. Remove the top cover as described in “Removing and Replacing the Server Top Cover” section on page 3-7.

d. Remove PCIe riser 1 to provide access to the USB flash drive socket that is on the motherboard (see Figure 3-22).

See Replacing a PCIe Riser, page 3-32 for more information.

e. Pull the USB flash drive from the slot.

**Step 2**
Install a USB flash drive:

a. Insert the USB flash drive into the socket.

b. Replace PCIe riser 1 to the server.

See Replacing a PCIe Riser, page 3-32 for more information.

c. Replace the top cover.

d. Replace the server in the rack, replace cables, and then power on the server by pressing the Power button.
Enabling or Disabling the Internal USB Port

The factory default is for all USB ports on the server to be enabled. However, the internal USB port can be enabled or disabled in the server BIOS. To enable or disable the internal USB port, follow these steps:

**Step 1** Enter the BIOS Setup utility by pressing the F2 key when prompted during bootup.

**Step 2** Navigate to the **Advanced** tab.

**Step 3** On the Advanced tab, select **USB Configuration**.

**Step 4** On the USB Configuration page, select **USB Ports Configuration**.

**Step 5** Scroll to **USB Port: Internal**, press **Enter**, and then select either Enabled or Disabled from the pop-up menu.

**Step 6** Press F10 to save and exit the utility.
Replacing the SuperCap Power Module (RAID Backup Unit)

This server supports installation of one SuperCap power modules (SCPMs). The SCPM mounts inside a bracket that is next to the cooling fans (see Figure 3-23).

The SCPM is supported only when using the LSI MegaRAID-CV controller card. This supercap module provides approximately 3 years of backup for the disk write-back cache DRAM in the case of sudden power loss by offloading the cache to the NAND flash.

To replace the RAID backup unit, follow these steps:

**Step 1**
Remove an SCPM (see Figure 3-23).

a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.

b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

**Caution**
If you cannot safely view and access the component, remove the server from the rack.

c. Remove the top cover as described in the “Removing and Replacing the Server Top Cover” section on page 3-7.

d. Disconnect the cable from the existing SCPM.

e. Slide the SCPM free of the clips on the bracket (see Figure 3-23).

**Step 2**
Install a new SCPM:

a. Slide the new SCPM into the clips on the bracket.

b. Connect the cable from the RAID controller to the new SCPM.

c. Replace the top cover.

d. Replace the server in the rack, replace cables, and then power on the server by pressing the Power button.
Figure 3-23 Replacing an SCPM

1 SCPM bracket
Installing a Trusted Platform Module

The trusted platform module (TPM) is a small circuit board that attaches to a motherboard socket. The socket location is on the motherboard, below PCIe riser 2 (see Figure 3-24).

Note

For security purposes, the TPM is installed with a one-way screw. It cannot be removed with a standard screwdriver.

To install a trusted platform module (TPM), follow these steps:

Step 1

Prepare the server for component installation.

a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.

b. Slide the server out far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

Caution

If you cannot safely view and access the component, remove the server from the rack.

c. Remove the top cover as described in the “Removing and Replacing the Server Top Cover” section on page 3-7.

d. Remove PCIe riser 2 to provide access to the TPM socket that is on the motherboard (see Figure 3-24). See Replacing a PCIe Riser, page 3-32 for more information.

Step 2

Install a TPM (see Figure 3-24):

a. Locate the TPM socket on the motherboard, as shown in Figure 3-24.

b. Align the connector that is on the bottom of the TPM circuit board with the motherboard TPM socket. Align the screw hole and standoff on the TPM board with the screw hole adjacent to the TPM socket.

c. Push down evenly on the TPM to seat it in the motherboard socket.

d. Install the single one-way screw that secures the TPM to the motherboard.

e. If you removed PCIe riser 2, replace it now.

f. Replace the top cover.

g. Replace the server in the rack, replace cables, and then power on the server by pressing the Power button.

Step 3

Enable the TPM:

a. Watch during bootup for the F2 prompt, and then press F2 to enter BIOS setup.

b. Log into the BIOS Setup utility with your BIOS Administrator password.

c. On the BIOS Setup utility screen, select the Advanced tab.

d. Select Trusted Computing to open the TPM Security Device Configuration screen.

e. Change TPM SUPPORT to Enabled.

f. Press F10 to save your settings and reboot the server.
Step 4 Verify that the TPM is now enabled.
   a. Watch during bootup for the F2 prompt, and then press **F2** to enter BIOS setup.
   b. Log into the BIOS Setup utility with your BIOS Administrator password.
   c. Select the **Advanced** tab.
   d. Select **Trusted Computing** to open the TPM Security Device Configuration screen.
   e. Verify that TPM SUPPORT is Enabled.

**Note** If you want to use the Intel Trusted Execution Technology (TXT) feature, it must be enabled in the server BIOS as described in **Enabling the Intel Trusted Execution Technology (TXT) Feature For the TPM**, page 3-44.

---

**Enabling the Intel Trusted Execution Technology (TXT) Feature For the TPM**

Intel TXT provides greater protection for information that is used and stored on the business server. A key aspect of that protection is the provision of an isolated execution environment and associated sections of memory where operations can be conducted on sensitive data, invisibly to the rest of the system. Likewise, Intel TXT provides for a sealed portion of storage where sensitive data such as encryption keys can be kept, helping to shield them from being compromised during an attack by malicious code.

To enable the TXT feature, follow these steps:
Step 1
Verify that a TPM is now installed and enabled in the server:

a. Either attach a VGA monitor and USB keyboard to the server, or log in remotely to the Cisco IMC interface of the server and open a virtual KVM console window.

b. Reboot the server.

c. Watch during bootup for the F2 prompt, and then press F2 to enter BIOS setup.

d. Log in to the BIOS Setup utility with your BIOS Administrator password.

Note
You must be logged in as the BIOS administrator to perform this procedure. If you have not done so already, set a BIOS administrator password on the Security tab of the BIOS Setup utility.

e. Select the Advanced tab.

f. On the Advanced tab, select Trusted Computing to open the TPM Security Device Configuration screen.

g. Verify that TPM SUPPORT is Enabled. If it is not, set TPM SUPPORT to Enabled.

h. Press Escape to return to the BIOS Setup utility Advanced tab.

Step 2
Enable the Intel Trusted Execution Technology (TXT) feature:

Note
The Intel Trusted Execution Technology feature can be enabled only when the server has a TPM installed on the TPM header.

b. Set TXT Support to Enabled.

Step 3
On the same screen, verify that the Intel Virtualization Technology (VT) and the Intel VT for Directed I/O (VT-d) features are enabled (the factory default).

a. On the Intel TXT(LT-SX) Hardware Support screen, verify that VT-d Support and VT Support are both listed as Enabled.
   - If they are already enabled, skip to Step 4.
   - If VT-d Support and VT Support are not enabled, continue with the next steps to enable them.

b. Press Escape to return to the BIOS Setup utility Advanced tab.

c. On the Advanced tab, select Processor Configuration to open the Processor Configuration screen.

d. Set Intel (R) VT and Intel (R) VT-d to Enabled.

Step 4
Press F10 to save your changes and exit the BIOS Setup utility.

Step 5
Verify that the Intel TXT, VT, and VT-d features are enabled:

a. Reboot the server.

b. Watch during bootup for the F2 prompt, and then press F2 to enter BIOS setup.

c. Select the Advanced tab.

d. Select Intel TXT(LT-SX) Configuration and verify that TXT Support, VT-d Support, and VT Support are Enabled.
Re replacing a SCU Upgrade ROM Module

To remove and replace a module, use the following procedure.

**Step 1** Prepare the server for component installation:
- a. Power off the server as described in Shutting Down and Powering Off the Server, page 3-6.
- b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

**Caution** If you cannot safely view and access the component, remove the server from the rack.
- c. Remove the top cover as described in Removing and Replacing the Server Top Cover, page 3-7.

**Step 2** Remove the SCU upgrade ROM module:
- a. Locate the module on the motherboard (see Figure C-1).
- b. Grasp the printed circuit board of the module and lift it from the header.

**Note** The module has a small retention feature that must have clearance from the header before the module can be pulled up. Tilt the module back, then pull up as shown in Figure 3-25.

**Step 3** Install a new SCU upgrade ROM module:
- a. Align the module with the pins in the motherboard header.
- b. Gently press down on the module until it is seated and the retention feature locks into the header.

![Figure 3-25 SCU Upgrade ROM Module Retention Feature](image)

For more information about using the module and embedded RAID, see Embedded RAID Controller, page C-6.
Replacing a Software RAID Key Module

To remove and replace a software RAID key module, use the following procedure.

**Step 1** Prepare the server for component installation:
- a. Power off the server as described in Shutting Down and Powering Off the Server, page 3-6.
- b. Slide the server out the front of the rack far enough so that you can remove the top cover. You might have to detach cables from the rear panel to provide clearance.

**Caution** If you cannot safely view and access the component, remove the server from the rack.
- c. Remove the top cover as described in Removing and Replacing the Server Top Cover, page 3-7.

**Step 2** Remove the software RAID key module:
- a. Locate the module on the motherboard (see Figure C-1).
- b. Grasp the printed circuit board of the module and lift it from the header.

**Note** The module must have clearance from the retention clip on the header before the module can be pulled up. Open the retention clip, then pull up as shown in Figure 3-26.

**Step 3** Install a new software RAID key module:
- a. Align the module with the pins in the motherboard header.
- b. Gently press down on the module until it is seated and the retention clip locks over the module.

**Figure 3-26 Software RAID Key Module Retention Feature**

For more information about using the module and embedded RAID, see Embedded RAID Controller, page C-6.
Replacing Power Supplies

The server has one power supply.

- See Power Specifications, page A-2 for more information about the supported power supplies.
- See Rear Panel LEDs and Buttons, page 3-4 for information about the power supply LEDs.

To replace or install a power supply, follow these steps:

**Step 1** Remove the power supply that you are replacing (see Figure 3-27):

- a. Power off the server as described in the “Shutting Down and Powering Off the Server” section on page 3-6.
- b. Remove the power cord from the power supply that you are replacing.
- c. Grasp the power supply handle while pinching the release lever towards the handle.
- d. Pull the power supply out of the bay.

**Step 2** Install a new power supply:

- a. Grasp the power supply handle and insert the new power supply into the empty bay.
- b. Push the power supply into the bay until the release lever locks.
- c. Connect the power cord to the new power supply.
- d. Press the **Power** button to return the server to main power mode.

**Figure 3-27 Removing and Replacing Power Supplies**

Server Specifications

This appendix lists the technical specifications for the server and includes the following sections:

- Physical Specifications, page A-1
- Power Specifications, page A-2
- Environmental Specifications, page A-4

Physical Specifications

Table A-1 lists the physical specifications for the server.

<table>
<thead>
<tr>
<th>Description</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height</td>
<td>1.7 in. (4.32 cm)</td>
</tr>
<tr>
<td>Width</td>
<td>16.9 in. (43.00 cm)</td>
</tr>
<tr>
<td>Depth</td>
<td>26.0 in. (66.04 cm)</td>
</tr>
<tr>
<td>Weight (fully loaded chassis)</td>

Power Cord Specifications

This appendix provides supported power cable specifications.

Supported Power Cords and Plugs

Each power supply has a separate power cord. Standard power cords or jumper power cords are available for connection to the server. The jumper power cords, for use in racks, are available as an optional alternative to the standard power cords.

Note

Only the approved power cords or jumper power cords provided with the server are supported.

Table B-1 lists the power cords for the server power supplies.

APPENDIX C

RAID Controller Considerations

This appendix contains the following sections:

- Supported RAID Controllers and Required Cables, page C-2
- RAID Card Firmware Compatibility, page C-3
- Mixing Drive Types in RAID Groups, page C-3
- SuperCap Power Modules (RAID Backup Units), page C-5
- RAID Controller Migration, page C-5
- Embedded RAID Controller, page C-6
- RAID Controller Cabling, page C-19
- Restoring RAID Configuration After Replacing a RAID Controller, page C-24
- For More Information, page C-24
## Supported RAID Controllers and Required Cables

This server supports the RAID controller options and cable requirements shown in Table C-1 for the small form factor version, or Table C-2 for the large form factor version of the server.

### Caution

Do not mix controller types in the server. Do not use the embedded MegaRAID controller and a hardware RAID controller card at the same time. This is not supported and could result in data loss.

### Note

Dual controllers are not supported.

### Note

The cables in this section apply to both single- and dual-CPU configurations.

Table C-1 lists the RAID options for the small form factor (SFF) version of the server.

### Table C-1 Cisco UCS C22 Small Form Factor RAID Options

<table>
<thead>
<tr>
<th>Controller</th>
<th>Style</th>
<th>Maximum Drives</th>
<th>SCPM&lt;sup&gt;1&lt;/sup&gt;</th>
<th>RAID Levels Supported</th>
<th>Required Cables</th>
</tr>
</thead>
<tbody>
<tr>
<td>Embedded MegaRAID&lt;sup&gt;2&lt;/sup&gt;</td>
<td>Onboard</td>
<td>4 SATA (default) or 8 SAS&lt;sup&gt;3&lt;/sup&gt; internal</td>
<td>No</td>
<td>0, 1, 5&lt;sup&gt;4&lt;/sup&gt;, 10</td>
<td>2 mini-SAS: UCSC-CABLE-AE</td>
</tr>
<tr>
<td>LSI MegaRAID 9220-4i</td>
<td>PCIe</td>
<td>4 internal&lt;sup&gt;5&lt;/sup&gt;</td>
<td>No</td>
<td>0, 1, 10</td>
<td>4 drives: 1 mini-SAS UCSC-CABLE-A5</td>
</tr>
<tr>
<td>LSI MegaRAID SAS 9220-8i</td>
<td>PCIe</td>
<td>8 internal</td>
<td>No</td>
<td>0, 1, 10</td>
<td>4 drives: 1 mini-SAS 8 drives: 2 mini-SAS UCSC-CABLE-A5</td>
</tr>
<tr>
<td>LSI MegaRAID SAS 9240-8i</td>
<td>PCIe</td>
<td>8 internal</td>
<td>No</td>
<td>0, 1, 5, 10, 50</td>
<td>4 drives: 1 mini-SAS 8 drives: 2 mini-SAS UCSC-CABLE-A5</td>
</tr>
<tr>
<td>LSI MegaRAID SAS 9265CV-8i</td>
<td>PCIe</td>
<td>8 internal</td>
<td>SCPM</td>
<td>0, 1, 5, 6, 10, 50, 60</td>
<td>4 drives: 1 mini-SAS 8 drives: 2 mini-SAS UCSC-CABLE-A5</td>
</tr>
</tbody>
</table>

1. SCPM = SuperCap power module (the RAID backup unit).
2. The embedded RAID controller must be enabled in the BIOS.
4. Embedded RAID 5 support requires an optional software key module.
5. The 9220-4i controller can create a RAID array with maximum 4 drives, even if it detects more than 4 drives.
Table C-2 lists the RAID options for the large form factor (LFF) version of the server.

### Table C-2  Cisco UCS C22 Large Form Factor RAID Options

<table>
<thead>
<tr>
<th>Controller</th>
<th>Style</th>
<th>Maximum Drives</th>
<th>SCPM¹</th>
<th>RAID Levels Supported</th>
<th>Required Cables</th>
</tr>
</thead>
<tbody>
<tr>
<td>Embedded MegaRAID²</td>
<td>Onboard</td>
<td>4 SATA (default) or 4 SAS³ internal</td>
<td>No</td>
<td>0, 1, 5⁴, 10</td>
<td>4 drives: 1 mini-SAS UCSC-CABLE-A9</td>
</tr>
<tr>
<td>LSI MegaRAID 9220-4i</td>
<td>PCIe</td>
<td>4 internal</td>
<td>No</td>
<td>0, 1, 10</td>
<td>4 drives: 1 mini-SAS UCSC-CABLE-A10</td>
</tr>
<tr>
<td>LSI MegaRAID SAS 9240-8i</td>
<td>PCIe</td>
<td>4 internal</td>
<td>No</td>
<td>0, 1, 5, 10, 50</td>
<td>4 drives: 1 mini-SAS UCSC-CABLE-A10</td>
</tr>
<tr>
<td>LSI MegaRAID SAS 9265CV-8i</td>
<td>PCIe</td>
<td>4 internal</td>
<td>SCPM</td>
<td>0, 1, 5, 6, 10, 50, 60</td>
<td>4 drives: 1 mini-SAS UCSC-CABLE-A10</td>
</tr>
</tbody>
</table>

1. SCPM = SuperCap power module (the RAID backup unit).
2. The embedded RAID controller must be enabled in the BIOS.
4. Embedded RAID 5 support requires an optional software key module.

### RAID Card Firmware Compatibility

If the PCIe card that you are installing is a RAID controller card, firmware on the RAID controller must be verified for compatibility with the current Cisco IMC and BIOS versions that are installed on the server. If not compatible, upgrade or downgrade the RAID controller firmware accordingly using the Host Upgrade Utility (HUU) for your firmware release to bring it to a compatible level.

See the HUU guide for your Cisco IMC release for instructions on downloading and using the utility to bring server components to compatible levels: HUU Guides

### Mixing Drive Types in RAID Groups

Table C-3 lists the technical capabilities for mixing hard disk drive (HDD) and solid state drive (SSD) types in a RAID group. However, see the best practices recommendations that follow for the best performance.

### Table C-3  Drive Type Mixing in RAID Groups

<table>
<thead>
<tr>
<th>Mix of Drive Types in RAID Group</th>
<th>Allowed?</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS HDD + SATA HDD</td>
<td>Yes</td>
</tr>
<tr>
<td>SAS SSD + SATA SSD</td>
<td>Yes</td>
</tr>
<tr>
<td>HDD + SSD</td>
<td>No</td>
</tr>
</tbody>
</table>

### Best Practices For Mixing Drive Types in RAID Groups

For the best performance, follow these guidelines:

- Use either all SAS or all SATA drives in a RAID group.
• Use the same capacity for each drive in the RAID group.
• Never mix HDDs and SSDs in the same RAID group.
SuperCap Power Modules (RAID Backup Units)

This server supports installation of one SuperCap power module (SCPM). The backup unit mounts to a holder near the cooling fans (see Figure 3-23). The SCPM is available only when using the optional LSI MegaRAID-CV controller cards. This supercap module provides approximately 3 years of backup for the disk write-back cache DRAM in the case of sudden power loss by offloading the cache to the NAND flash.

For SCPM replacement instructions, see Replacing the SuperCap Power Module (RAID Backup Unit), page 3-41.

RAID Controller Migration

This server supports hardware RAID (PCIe controller cards) and embedded software RAID. See Table C-4 for which migrations are allowed and a summary of migration steps.

<table>
<thead>
<tr>
<th>Starting RAID Controller</th>
<th>Migrate to HW RAID Allowed?</th>
<th>Migrate to SW RAID Allowed?</th>
</tr>
</thead>
<tbody>
<tr>
<td>None (no drives)</td>
<td>Allowed</td>
<td>Allowed</td>
</tr>
<tr>
<td>Onboard SCU Storage support is Disabled in BIOS</td>
<td>1. Install card.</td>
<td>1. Install desired upgrade modules to motherboard.</td>
</tr>
<tr>
<td></td>
<td>2. Install cables.</td>
<td>2. Enable SCU storage support in BIOS.</td>
</tr>
<tr>
<td>Embedded SW RAID</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Onboard SCU Storage support is Enabled in BIOS</td>
<td><strong>Caution</strong> Data migration from SW RAID to HW RAID is <em>not</em> supported and could result in data loss.</td>
<td>Not applicable</td>
</tr>
<tr>
<td></td>
<td>Allowed only <em>before</em> there is data on the drives; data migration is not supported.</td>
<td></td>
</tr>
<tr>
<td>HW RAID</td>
<td>Not applicable</td>
<td>Not allowed</td>
</tr>
<tr>
<td>Onboard SCU Storage support is Disabled in BIOS</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Embedded RAID Controller

Note
VMware ESX/ESXi or any other virtualized environments are not supported for use with the embedded MegaRAID controller. Hypervisors such as Hyper-V, Xen, or KVM are also not supported for use with the embedded MegaRAID controller.

This server includes an embedded MegaRAID controller with two mini-SAS connectors on the motherboard.

- The default setting for this embedded controller is RAID 0, 1, and 10 support for up to four SATA drives.
- You can upgrade this to support up to eight SAS drives (SAS RAID 0/1/10) by installing a Storage Controller Unit (SCU) upgrade ROM chip on the motherboard. See Installing a SCU Upgrade ROM Module For Embedded RAID SAS Support, page C-8.
- You can further upgrade to add SAS RAID 5 support with an optional software key. See Installing a Software RAID Key Module for Embedded RAID 5 Support, page C-9.
- When you order the server with this controller, the controller is enabled in the BIOS. Instructions for enabling the controller are included for the case in which a server is reset to defaults (Disabled). See Enabling the Embedded RAID Controller in the BIOS, page C-9.

Note
You cannot downgrade from using a RAID controller card to using the embedded controller (see RAID Controller Migration, page C-5). Instructions for installing upgrade modules and enabling the embedded controller in the BIOS are included here for those upgrading a server with no RAID controller or drives.

Caution
Data migration from SW RAID (embedded RAID) to HW RAID (a controller card) is not supported and could result in data loss. Migrations from SW RAID to HW RAID are supported only before there is data on the drives, or the case in which there are no drives in the server (see RAID Controller Migration, page C-5).

- You can migrate from using the embedded controller to using a RAID card only before there is data on the drives. In this case, you must disable the embedded controller. See Disabling the Embedded RAID Controller in the BIOS, page C-10.
- The required drivers for this controller are already installed and ready to use with the LSI SWRAID Configuration Utility. However, if you will use this controller with Windows or Linux, you must download and install additional drivers for those operating systems. See Installing LSI MegaSR Drivers For Windows and Linux, page C-10.

This section contains the following topics:

- Notes on Supported Embedded MegaRAID Levels, page C-7
- Installing a SCU Upgrade ROM Module For Embedded RAID SAS Support, page C-8
- Installing a Software RAID Key Module for Embedded RAID 5 Support, page C-9
- Enabling the Embedded RAID Controller in the BIOS, page C-9
- Disabling the Embedded RAID Controller in the BIOS, page C-10
- Launching the LSI Embedded RAID Configuration Utility, page C-10
- Installing LSI MegaSR Drivers For Windows and Linux, page C-10
Notes on Supported Embedded MegaRAID Levels

The following RAID levels are supported by the embedded MegaRAID controller.

- RAID 0—You can configure a RAID 0 virtual drive (VD) using one or more physical drives (PDs). This level supports up to eight VDs and PDs.
- RAID 1—A RAID 1 VD is configured from only two PDs. This level supports up to eight PDs (four RAID arrays) and eight VDs.
- RAID 5—You can configure a RAID 5 VD using three or more PDs. This level supports up to eight PDs and eight VDs.
- RAID 10—This is a spanned VD; that is, RAID 0 is implemented on two or more RAID 1 VDs. This level supports up to eight PDs (two to four RAID 1 volumes spanned) and one VD.

Note: None of these RAID levels require drives of the same size. The smallest drive in the array determines the size of the VD.

Note: An array can be divided into multiple VDs of the same RAID level, except when using RAID 10. Mixed arrays are not permitted. For example, you cannot configure a three-drive array into RAID 0 and RAID 5 VDs. Unlike RAID 0, 1, and 5, you cannot create multiple RAID 10 VDs from the same array. A single RAID 10 VD uses up the entire array.
Installing a SCU Upgrade ROM Module For Embedded RAID SAS Support

The SCU Upgrade ROM module contains a chip on a small circuit board. This module attaches to a motherboard header. This chip adds SAS support for up to eight drives.

Note

The Cisco PID UCSC-RAID-ROM5= includes the SCU upgrade ROM module.
The Cisco PID UCSC-RAID-ROM55= includes the SCU upgrade ROM module and the RAID 5 key.

To install a SCU upgrade ROM module, follow these steps:

Step 1 Locate the header (see Figure C-1).
Step 2 Align the connector on the SCU upgrade ROM module with the pins on the header, then gently push the connector onto the pins.
Step 3 Replace the top cover.
Step 4 Replace the server in the rack, replace cables, and then power on by pressing the Power button.
Step 5 Continue with either Installing a Software RAID Key Module for Embedded RAID 5 Support, page C-9 or Enabling the Embedded RAID Controller in the BIOS, page C-9.

Figure C-1  SCU Upgrade ROM and RAID 5 Key Header Locations on Motherboard

1 SCU upgrade ROM header  2 Software RAID 5 key header
Installing a Software RAID Key Module for Embedded RAID 5 Support

The software RAID key module contains a chip on a small circuit board. This module attaches to a motherboard header. This chip upgrades SAS support to add RAID 5 support (RAID 0, 1, 5, and 10 for up to eight drives).

Note
You must have the SCU upgrade ROM module installed before you can use this module.

To install a RAID 5 software key module, follow these steps:

Step 1 Locate the header (see Figure C-1).
Step 2 Install the RAID 5 software key module onto the pins of the header.
Step 3 Replace the top cover.
Step 4 Replace the server in the rack, replace cables, and then power on the server by pressing the Power button.

Enabling the Embedded RAID Controller in the BIOS

Note
The embedded RAID controller uses different cables than the PCIe card controllers. See Supported RAID Controllers and Required Cables, page C-2 and RAID Controller Cabling, page C-19.

Note
The default setting in the BIOS for the embedded controller is Disabled. When you order the server with the embedded controller, the BIOS setting is Enabled at the factory. However, if a server is reset to defaults, this BIOS setting is reverted to Disabled. Use the procedure below to re-enable the embedded controller.

Use the following procedure to enable the LSI MegaSR drivers.

Step 1 Boot the server and press F2 when prompted to enter the BIOS Setup utility.
Step 2 Select the Advanced tab, then South Bridge.
Step 3 Set Onboard SATA Controller to Enabled.
Step 4 Press F10 to save your changes and exit the utility.
Disabling the Embedded RAID Controller in the BIOS

⚠️ Caution ⚠️
Data migration from SW RAID to HW RAID is not supported and could result in data loss. Migrations from SW RAID to HW RAID are supported only before there is data on the drives, or the case in which there are no drives in the server.

If you change from using this embedded controller to a RAID controller card, you must disable the embedded controller in the server BIOS.

📝 Note
The embedded RAID controller uses different cables than the PCIe card controllers. See Supported RAID Controllers and Required Cables, page C-2 and RAID Controller Cabling, page C-19.

Use the following procedure to disable the LSI MegaSR drivers.

**Step 1**
Boot the server and press **F2** when prompted to enter the BIOS Setup utility.

**Step 2**
Select the **Advanced** tab, then **South Bridge**.

**Step 3**
Set Onboard SATA Controller to **Disabled**.

**Step 4**
Press **F10** to save your changes and exit the utility.

Launching the LSI Embedded RAID Configuration Utility

Launch the utility by pressing **Ctrl+M** when you see the prompt during system boot.

For more information about using the Embedded MegaRAID software to configure your disk arrays, see the LSI Embedded MegaRAID Software User Guide.

Installing LSI MegaSR Drivers For Windows and Linux

📝 Note
The required drivers for this controller are already installed and ready to use with the LSI SWRAID Configuration Utility. However, if you will use this controller with Windows or Linux, you must download and install additional drivers for those operating systems.

This section explains how to install the LSI MegaSR drivers for the following supported operating systems:

- Microsoft Windows Server
- Red Hat Enterprise Linux (RHEL)
- SuSE Linux Enterprise Server (SLES)

For the specific supported OS versions, see the Hardware and Software Interoperability Matrix for your server release.
This section contains the following topics:

- Downloading the LSI MegaSR Drivers, page C-11
- Microsoft Windows Driver Installation, page C-11
- Linux Driver Installation, page C-14

### Downloading the LSI MegaSR Drivers

The MegaSR drivers are included in the C-series driver ISO for your server and OS. Download the drivers from Cisco.com:

**Step 1** Find the drivers ISO file download for your server online and download it to a temporary location on your workstation:

- a. See the following URL: [http://www.cisco.com/cisco/software/navigator.html](http://www.cisco.com/cisco/software/navigator.html)
- b. Click **Unified Computing and Servers** in the middle column.
- c. Click **Cisco UCS C-Series Rack-Mount Standalone Server Software** in the right-hand column.
- d. Click your model of server in the right-hand column.
- e. Click **Unified Computing System (UCS) Drivers**.
- f. Click the release number that you are downloading.
- g. Click **Download** to download the drivers ISO file.
- h. Verify the information on the next page, then click **Proceed With Download**.
- i. Continue through the subsequent screens to accept the license agreement and then browse to a location where you want to save the drivers ISO file.

### Microsoft Windows Driver Installation

This section explains the steps to install the LSI MegaSR driver in a Windows installation.

This section contains the following topics:

- Windows Server 2008R2 Driver Installation, page C-11
- Updating the Windows Driver, page C-12
- Linux Driver Installation, page C-14

### Windows Server 2008R2 Driver Installation

For the specific supported OS versions, see the Hardware and Software Interoperability Matrix for your server release.

Perform the following steps to install the LSI MegaSR device driver in a new Windows Server 2008R2 operating system. The Windows operating system automatically adds the driver to the registry and copies the driver to the appropriate directory.

**Step 1** Create a RAID drive group using the LSI SWRAID Configuration utility before you install this driver for Windows. Launch this utility by pressing **Ctrl+M** when LSI SWRAID is shown during BIOS post.
Step 2  Download the Cisco UCS C-Series drivers ISO, as described in Downloading the LSI MegaSR Drivers, page C-11.

Step 3  Prepare the drivers on a USB thumb drive:
   a. Burn the ISO image to a disc.
   b. Browse the contents of the drivers folders to the location of the embedded MegaRAID drivers:
      /<OS>/Storage/Intel/C600/
   c. Expand the Zip file, which contains the folder with the MegaSR driver files.
   d. Copy the expanded folder to a USB thumb drive.

Step 4  Start the Windows driver installation using one of the following methods:
   • To install from local media: Connect an external USB DVD drive to the server and then insert the first Windows install disc into the drive. Skip to Step 6.
   • To install from remote ISO: Log in to the server’s Cisco IMC interface and continue with the next step.

Step 5  Launch a Virtual KVM console window and select the Virtual Media tab.
   a. Click Add Image and browse to select your remote Windows installation ISO file.
   b. Select the check box in the Mapped column for the media that you just added, then wait for mapping to complete.

Step 6  Power cycle the server.

Step 7  Press F6 when you see the F6 prompt during bootup. The Boot Menu window opens.

Step 8  On the Boot Manager window, select the physical disc or virtual DVD and press Enter. The Windows installation begins when the image is booted.

Step 9  Press Enter when you see the prompt, “Press any key to boot from CD.”

Step 10 Observe the Windows installation process and respond to prompts in the wizard as required for your preferences and company standards.

Step 11 When Windows prompts you with “Where do you want to install Windows,” install the drivers for embedded MegaRAID:
   a. Click Load Driver. You are prompted by a Load Driver dialog to select the driver to be installed.
   b. Connect the USB thumb drive that you prepared in Step 3 to the target server.
   c. On the Windows Load Driver dialog that you opened in Step a, click Browse.
   d. Use the dialog to browse to the location of the drivers folder on the USB thumb drive, and click OK. Windows loads the drivers from the folder and when finished, the driver is listed under the prompt, “Select the driver to be installed.”
   e. Click Next to install the drivers.

---

**Updating the Windows Driver**

Perform the following steps to update the LSI MegaSR driver for Windows or to install this driver on an existing system booted from a standard IDE drive.

**Step 1**  Click Start, point to Settings, and then click Control Panel.

**Step 2**  Double-click System, click the Hardware tab, and then click Device Manager. Device Manager starts.
**Step 3**  In Device Manager, double-click **SCSI and RAID Controllers**, right-click the device for which you are installing the driver, and then click **Properties**.

**Step 4**  On the Driver tab, click **Update Driver** to open the Update Device Driver wizard, and then follow the wizard instructions to update the driver.
Linux Driver Installation

This section explains the steps to install the embedded MegaRAID device driver in a Red Hat Enterprise Linux installation or a SuSE Linux Enterprise Server installation.

This section contains the following topics:

- Obtaining the Driver Image File, page C-14
- Preparing Physical Installation Diskettes For Linux, page C-14
- Installing the Red Hat Linux Driver, page C-16
- Installing the SUSE Linux Enterprise Server Driver, page C-17

Obtaining the Driver Image File

See Downloading the LSI MegaSR Drivers, page C-11 for instructions on obtaining the drivers. The Linux driver is offered in the form of dud-[driver version].img, which is the boot image for the embedded MegaRAID stack.

Note

The LSI MegaSR drivers that Cisco provides for Red Hat Linux and SUSE Linux are for the original GA versions of those distributions. The drivers do not support updates to those OS kernels.

Preparing Physical Installation Diskettes For Linux

This section describes how to prepare physical Linux installation diskettes from the driver image files, using either the Windows operating system or the Linux operating system.

Note

Alternatively, you can mount the dud.img file as a virtual floppy disk, as described in the installation procedures.

Preparing Physical Installation Diskettes With the Windows Operating System:

Under Windows, you can use the RaWrite floppy image-writer utility to create disk images from image files. Perform the following steps to build installation diskettes.

Step 1

Download the Cisco UCS C-Series drivers ISO, as described in Downloading the LSI MegaSR Drivers, page C-11 and save it to your Windows system that has a diskette drive.

Step 2

Extract the dud.img file:

a. Burn the ISO image to a disc.

b. Browse the contents of the drivers folders to the location of the embedded MegaRAID drivers:

   /<OS>/Storage/Intel/C600/

c. Expand the Zip file, which contains the folder with the driver files.

Step 3

Copy the driver update disk image dud-[driver version].img and your file raw write.exe to a directory.

Note

RaWrite is not included in the driver package.
Step 4  If necessary, use this command to change the file name of the driver update disk to a name with fewer than eight characters: copy dud-[driver version].img dud.img
Step 5  Open the DOS Command Prompt and navigate to the directory where raw write.exe is located.
Step 6  Type the following command to create the installation diskette: raw write
Step 7  Press Enter.
You are prompted to enter the name of the boot image file.
Step 8  Type the following: dud.img
Step 9  Press Enter.
You are prompted for the target diskette.
Step 10 Insert a floppy diskette into the floppy drive and type: A:
Step 11 Press Enter.
Step 12 Press Enter again to start copying the file to the diskette.
Step 13 After the command prompt returns and the floppy disk drive LED goes out, remove the diskette.
Step 14 Label the diskette with the image name.

Preparing Installation Disks With a Linux Operating System:
Under Red Hat Linux and SuSE Linux, you can use a driver diskette utility to create disk images from image files. Perform the following steps to create the driver update disk:

Step 1 Download the Cisco UCS C-Series drivers ISO, as described in Downloading the LSI MegaSR Drivers, page C-11 and save it to your Linux system that has a diskette drive.
Step 2 Extract the dud.img file:
   a. Burn the ISO image to a disc.
   b. Browse the contents of the drivers folders to the location of the embedded MegaRAID drivers:

   /<OS>/Storage/Intel/C600/

   c. Expand the Zip file, which contains the folder with the driver files.
Step 3 Copy the driver update disk image dud-[driver version].img to your Linux system.
Step 4 Insert a blank floppy diskette into the floppy drive.
Step 5 Confirm that the files are in the selected directory.
Step 6 Create the driver update diskette using the following command:

   dd if=dud-[driver version].img of=/dev/fd0
Step 7 After the command prompt returns and the floppy disk drive LED goes out, remove the diskette.
Step 8 Label the diskette with the image name.
Installing the Red Hat Linux Driver

For the specific supported OS versions, see the Hardware and Software Interoperability Matrix for your server release.

This section describes the fresh installation of the Red Hat Enterprise Linux device driver on systems with the embedded MegaRAID stack.

---

**Step 1**  Create a RAID drive group using the LSI SWRAID Configuration utility before you install this driver for the OS. Launch this utility by pressing Ctrl+M when LSI SWRAID is shown during BIOS post.

**Step 2**  Prepare the dud.img file using one of the following methods:

- To install from a physical diskette: Use one of the procedures in Preparing Physical Installation Diskettes For Linux, page C-14.
  Then return to Step 4 of this procedure.
- To install from a virtual floppy disk: Download and save the Cisco UCS C-Series drivers ISO, as described in Downloading the LSI MegaSR Drivers, page C-11.
  Then continue with the next step.

**Step 3**  Extract the dud.img file:

- a. Burn the ISO image to a disc.
- b. Browse the contents of the drivers folders to the location of the embedded MegaRAID drivers:
  /<OS>/Storage/Intel/C600/
- c. Copy the dud-&lt;driver version&gt;.img file to a temporary location on your workstation.

**Step 4**  Start the Linux driver installation using one of the following methods:

- a. To install from local media: Connect an external USB DVD drive to the server and then insert the first RHEL install disc into the drive.
  Then continue with Step 6.
- b. To install from remote ISO: Log in to the server’s Cisco IMC interface. Then continue with the next step.

**Step 5**  Launch a Virtual KVM console window and select the Virtual Media tab.

- a. Click Add Image and browse to select your remote RHEL installation ISO file.
- b. Click Add Image again and browse to select your dud.img file.
- c. Select the check boxes in the Mapped column for the media that you just added, then wait for mapping to complete.

**Step 6**  Power cycle the server.

**Step 7**  Press F6 when you see the F6 prompt during bootup. The Boot Menu window opens.

**Step 8**  On the Boot Manager window, select the physical disc or virtual DVD and press Enter.

The RHEL installation begins when the image is booted.

**Step 9**  Press Esc to go to the CLI boot prompt.

**Step 10**  Type one of the following commands at the boot prompt:

- For RHEL 5.x (32- and 64-bit), type:
  \texttt{linux dd blacklist=isci blacklist=ahci noprobe=<ata\textunderscore drive number>}
- For RHEL 6.x (32- and 64-bit), type:
  \texttt{linux dd blacklist=isci blacklist=ahci nodmraid noprobe=<ata\textunderscore drive number>}

---
The `noprobe` values depend on the number of drives. For example, to install RHEL 5.7 on a RAID 5 configuration with three drives, enter:

```
linux dd blacklist=iscsi blacklist=ahci noprobe=ata1 noprobe=ata2 noprobe=ata3
```

**Step 11** Press Enter.

The prompt asks whether you have a driver disk.

**Step 12** Use the arrow key to select **Yes**, and then press **Enter**.

**Step 13** Select **fd0** to indicate that you have a floppy diskette with the driver on it.

**Step 14** Do one of the following actions:

- If you prepared the IMG file on a physical diskette in **Step 2**: Connect an external USB diskette drive to the target server and then insert the diskette in the A:/ drive and press **Enter**.
- If you mapped the IMG file as a virtual floppy in **Step 5**: Select the location of the virtual floppy.

The installer locates and loads the driver for your device. The following message appears:

```
Loading megasr driver...
```

**Step 15** Follow the Red Hat Linux installation procedure to complete the installation.

**Step 16** Reboot the system.

---

### Installing the SUSE Linux Enterprise Server Driver

For the specific supported OS versions, see the Hardware and Software Interoperability Matrix for your server release.

This section describes the installation of the SuSE Linux Enterprise Server driver on a system with the embedded MegaRAID stack.

Use the following procedure to install the SLES drivers.

**Step 1** Create a RAID drive group using the LSI SWRAID Configuration utility before you install this driver for the OS. Launch this utility by pressing **Ctrl+M** when LSI SWRAID is shown during BIOS post.

**Step 2** Prepare the `dud.img` file using one of the following methods:

- To install from a physical diskette: Use one of the procedures in Preparing Physical Installation Diskettes For Linux, page C-14.
  
  Then return to **Step 4** of this procedure.

- To install from a virtual floppy disk: Download and save the Cisco UCS C-Series drivers ISO, as described in Downloading the LSI MegaSR Drivers, page C-11.
  
  Then continue with the next step.

**Step 3** Extract the `dud.img` file:

- **a.** Burn the ISO image to a disc.
- **b.** Browse the contents of the drivers folders to the location of the embedded MegaRAID drivers:

  ```
  /<OS>/Storage/Intel/C600/
  ```

- **c.** Copy the `dud:<driver version>.img` file to a temporary location on your workstation.

**Step 4** Start the Linux driver installation using one of the following methods:

- To install from local media: Connect an external USB DVD drive to the server and then insert the first RHEL install disc into the drive. Skip to **Step 6**.
To install from remote ISO: Log in to the server’s Cisco IMC interface and continue with the next step.

**Step 5**
Launch a Virtual KVM console window and select the Virtual Media tab.
- a. Click Add Image and browse to select your remote RHEL installation ISO file.
- b. Click Add Image again and browse to select your dud.img file.
- c. Select the check box in the Mapped column for the media that you just added, then wait for mapping to complete.

**Step 6**
Power cycle the server.

**Step 7**
Press F6 when you see the F6 prompt during bootup. The Boot Menu window opens.

**Step 8**
On the Boot Manager window, select the physical disc or virtual DVD and press Enter. The SLES installation begins when the image is booted.

**Step 9**
When the first SLES screen appears, select Installation on the menu.

**Step 10**
Type one of the following in the Boot Options field:
- For SLES 11 and SLES 11 SP1 (32- and 64-bit), type: brokenmodules=ahci
- For SLES 11 SP2 (32-and 64-bit), type: brokenmodules=ahci brokenmodules=isci

**Step 11**
Press F6 for the driver and select Yes.

**Step 12**
Do one of the following actions:
- If you prepared the IMG file on a physical diskette in Step 2: Connect an external USB diskette drive to the target server and then insert the diskette in the A:/ drive and press Enter.
- If you mapped the IMG file as a virtual floppy in Step 5: Select the location of the virtual floppy. “Yes” appears under the F6 Driver heading.

**Step 13**
Press Enter to select Installation.

**Step 14**
Press OK.

The following message appears: LSI Soft RAID Driver Updates added.

**Step 15**
At the menu, select the driver update medium and press the Back button.

**Step 16**
Continue and complete the installation process by following the prompts.
RAID Controller Cabling

This section includes the following topics:

- Cable Routing, page C-19
- Cisco UCS C22 Server Cabling, page C-21

Cable Routing

The RAID controller connectors in this server are shown in Figure C-2. The colored lines indicate the recommended cable-routing paths from the backplane to the possible controller locations:

- The red line is the cable path to a controller in PCIe riser 1. This is the only riser available in single-CPU configurations.
- The blue line is the cable path to a controller in PCIe riser 2.
- The green line is the cable path to the embedded RAID connectors on the motherboard.

---

Note

The foam rubber air dam must be in place to ensure correct air flow. Place the air dam where item 3 is shown below when there is no supercap power module (SCPM) in the bracket on the chassis floor. Place the air dam where item 4 is shown below when there is an SCPM. The end of the air dam that sits next to the fan or CPU cover has an opening that allows the cables to run under it.
Figure C-2  RAID Controller Connectors and Cable Routing

1. Drive backplane
2. SCPM mounting location (bracket on chassis floor)
3. Air dam primary position when no SCPM is installed
4. Air dam position when SCPM is installed
5. Embedded RAID SAS connectors on motherboard (Left to right: SCU_Port 0, SCU_Port 1)
6. PCIe risers for RAID controller cards
Cisco UCS C22 Server Cabling

This section contains the following topics:

- Backplane and Expander Options, page C-21
- Small Form Factor 8-Drive Backplane Cabling, page C-21
- Large Form Factor 4-Drive Backplane Cabling, page C-23

Backplane and Expander Options

The server is orderable in two different versions, each with one of two different front panel/backplane configurations:

- Cisco UCS C22 (small form-factor (SFF) drives, with 8-drive backplane). Holds up to eight 2.5-inch hard drives or solid state drives.
- Cisco UCS C22 (large form factor (LFF) drives, with 4-drive backplane). Holds up to four 3.5-inch hard drives.

Note: Dual controllers are not supported. Do not mix controller types in the server.

Small Form Factor 8-Drive Backplane Cabling

The cable connections required for each type of controller are as follows:

- Embedded RAID, page C-21
- LSI MegaRAID 9220-4i PCIe Card, page C-22
- LSI MegaRAID 9220-8i, 9240-8i, or 9265CV-8i PCIe Card, page C-22

Embedded RAID

This option can control up to eight internal drives.

The required UCSC-CABLE-AE cable kit has two mini-SAS cables. Cable 1 controls drives 1–4 and cable 2 controls drives 5–8.

Step 1  Connect mini-SAS cable 1 from the motherboard connector SCU_Port_0 to the drives 1–4 connectors on the backplane (see Figure C-2).

Step 2  Connect the cable 1 SGPIO connector labeled, “S1” to backplane connector A.

Step 3  Connect mini-SAS cable 2 from the motherboard connector SCU_Port_1 to the drives 5–8 connectors on the backplane.

Step 4  Connect the cable 2 SGPIO connector labeled, “S2” to backplane connector B.
LSI MegaRAID 9220-4i PCIe Card

This option can control up to four internal drives.
The required UCSC-CABLE-A5 cable kit has two mini-SAS cables. Cable 1 controls drives 1–4.

Step 1 Connect mini-SAS cable 1 from connector SAS1 on the card to the drives 1–4 connectors on the backplane.
Step 2 Connect the mini-SAS cable 1 SGPIO connector S1 to backplane connector A.

LSI MegaRAID 9220-8i, 9240-8i, or 9265CV-8i PCIe Card

These options can control up to eight internal drives.
The required UCSC-CABLE-A5 cable kit has two mini-SAS cables. Cable 1 controls drives 1–4 and cable 2 controls drives 5–8.

Step 1 Connect mini-SAS cable 1 from connector SAS1 on the card to the drives 1–4 connectors on the backplane.
Step 2 Connect the mini-SAS cable 1 SGPIO connector S1 to backplane connector A.
Step 3 Connect mini-SAS cable 2 from connector SAS2 on the card to the drives 5–8 connectors on the backplane.
Step 4 Connect the mini-SAS cable 2 SGPIO connector S2 to backplane connector B.
Large Form Factor 4-Drive Backplane Cabling

The cable connections required for each type of controller are as follows:

- Embedded RAID, page C-23
- LSI MegaRAID 9220-4i PCIe Card, page C-23
- LSI MegaRAID 9220-8i, 9240-8i, or 9265CV-8i PCIe Card, page C-23

**Embedded RAID**

This option can control up to four internal drives.

The required UCSC-CABLE-A9 cable kit has one mini-SAS cable that controls drives 1–4.

<table>
<thead>

Restoring RAID Configuration After Replacing a RAID Controller

When you replace a RAID controller, the RAID configuration that is stored in the controller is lost. Use the following procedure to restore your RAID configuration to your new RAID controller.

Step 1  Replace your RAID controller. See Replacing a PCIe Card, page 3-34.

Step 2  If this was a full chassis swap, replace all drives into the drive bays, in the same order that they were installed in the old chassis.

Step 3  Reboot the server and watch for the prompt to press F.

Note  For newer RAID controllers, you are not prompted to press F. Instead, the RAID configuration is imported automatically. In this case, skip to Step 6.

Step 4  Press F when you see the following on-screen prompt:

Foreign configuration(s) found on adapter.
Press any key to continue or ‘C’ load the configuration utility, or ‘F’ to import foreign configuration(s) and continue.

Step 5  Press any key (other than C) to continue when you see the following on-screen prompt:

All of the disks from your previous configuration are gone. If this is an unexpected message, then please power off your system and check your cables to ensure all disks are present.
Press any key to continue, or ‘C’ to load the configuration utility.

Step 6  Watch the subsequent screens for confirmation that your RAID configuration was imported correctly.

- If you see the following message, your configuration was successfully imported. The LSI virtual drive is also listed among the storage devices.

N Virtual Drive(s) found on host adapter.

- If you see the following message, your configuration was not imported. This can happen if you do not press F quickly enough when prompted. In this case, reboot the server and try the import operation again when you are prompted to press F.

0 Virtual Drive(s) found on host adapter.

For More Information

The LSI configuration utilities have help documentation for more information about using the utilities. For basic information about RAID and for using the utilities for the RAID controller cards that are supported by Cisco servers, see the Cisco UCS Servers RAID Guide.

For more information about using the Embedded MegaRAID software to configure your disk arrays, see the LSI Embedded MegaRAID Software User Guide.

Full LSI documentation is also available:
For basic information on RAID and how to use the LSI utilities, see the documentation at LSI.com:

- LSI MegaRAID SAS Software User's Guide (for LSI MegaRAID)
Installation for Cisco UCS Integration

The Cisco UCS Manager integration instructions have been moved to the integration guides found here: Cisco UCS C-Series Server Integration with UCS Manager Guides
Refer to the guide that is for the version of Cisco UCS Manager that you are using.

Also refer to the release notes for Cisco UCS Manager software and C-Series software for any special considerations regarding integration in your release.
