Wasp

BARCODE TECHNOLOGIES

# WLR8950

User Manual

Table of Contents

Introduction

Barcoding is the most common Automated Data Collection (ADC) technology providing timely, error-free information that can be used to increase productivity, accuracy, and efficiency in the workplace. Virtually every type of industry is using barcodes to replace keyboard data entry. Studies have shown that a proficient data entry operator will make one error for every 300 characters that are manually entered. The error rate using barcodes is almost negligible and can be error-free using barcode symbologies with the check digit enabled.

The Wasp Charged Coupled Device (CCD) technology is a technique whereby a barcode is photographed, digitized, and electronically sampled by built-in photodetectors. The detectors process the measurement of every bar and space using the number of adjacent photodetectors which contrast a black mark and a white space. Wasp WLR8950 series scanners are extremely rugged since they have no moving parts. Wasp WLR8950 series scanners support PS/2 or USB keyboard interfaces and easily wedges between the computer and keyboard. Barcode data is passed directly into the keyboard buffer as if it had been typed in by hand by a data entry operator.

Of all the hand held barcode scanning devices on the market, the CCD reader is the easiest to use and most cost effective for the typical business user. The Wasp WLR8950 series scanners are extended distance scanners with a depth of reading of up to one foot depending on the mil size of the barcode. To activate the scanner, the user simply points the scanning aperture towards the barcode, pulls the trigger, and aims the red LED beam across the barcode.
Barcode Symbologies

Barcodes are symbols consisting of a series of bars and spaces which can be applied to packages, cartons, bottles, and other commercial products. The bars and spaces in each symbol are grouped in such a way to represent a specific ASCII character or function. The interpretation of these groups is based on a particular set of rules called symbologies. Various symbologies have been developed for particular applications. Some examples are shipping and receiving, manufacturing, retail, healthcare, transportation, document processing and tracking, and libraries.

The resolution of a barcode is dependent on the narrowest element of a barcode (X dimension), and can vary from high density (nominally less than 0.009 in./0.23 mm), medium density (between 0.009 in./0.23 mm and 0.020 in./0.50 mm), and low density (greater than 0.020 in./0.50 mm). Medium and low densities are the most common since these are the easiest to read (scan) with nearly all scanning devices. Wasp WLR8950 Scanners can read barcodes with X-dimensions as low as 5 mils (0.005 in/0.13mm).

Wasp WLR8950 Scanners can read the most popular barcode symbologies including Code 39, Code 93, Code 128, Interleaved 2 of 5, UPC-A, UPC-E, EAN/JAN-8, EAN/JAN-13, Codabar, and MSI/Plessey.

Please see test chart on pages 25-26.

Installation

WLR8950 PS2 Scanner
1. Turn off your computer.
2. Unplug your PC keyboard cable and plug the male end (Din 6) of the WLR8950 Scanner directly into your PC keyboard port. Plug your keyboard cable into the other end (female Din 6) of the the scanner.
3. Turn your computer on.

WLR8950 USB Scanner
1. Plug the USB of the WLR8950 Scanner directly into your PC's USB port.

Quick Start

Your Wasp WLR8950 Scanners are ready for use. The default settings of the scanners have been pre-programmed for the most common barcode configurations. Use the "WLR8950 Setup & Configuration" sections only to customize the scanners settings. Please review the "Enable Barcode Symbologies" configuration beginning on page 15 to see the list of barcode symbologies which are enabled by default.

Tip:
• Use the pre-printed "Barcode Test Symbols" in Appendix A on pages 25-26 as a test chart to practice scanning.

Setup & Configuration

In order to configure Wasp WLR8950 Scanners, you must familiarize yourself with the setup procedures on the following pages. The default settings of the Wasp WLR8950 Scanners are identified on each page and clearly marked using an asterisk (*). **The default settings have been preprogrammed for the most common barcode configurations. Use the Setup & Configuration only to customize the Wasp WLR8950 Scanners settings.** If you need to configure the scanner, the default settings will be overwritten. All the programmed settings are stored permanently in non-volatile memory; therefore, your configuration will be maintained even if the keyboard power to Wasp WLR8950 Scanners is removed by turning off your PC.

In order to configure Wasp WLR8950 Series Scanners, two basic steps need to be followed:

(1) Locate the group that contains the options to be changed.
(2) Scan the barcode representing the option to be changed.
    The scanner will sound two beeps.

To change Minimum/Maximum Length:

(1) Scan the Minimum or Maximum Length barcode.
(2) Scan a 2 digit value from the ASCII table on pages 27-30.
(3) Scan the Minimum or Maximum Length barcode again.

Example: To have a minimum length barcode of 1, you must scan a 0 then 1, then scan the minimum barcode again. To have a maximum length barcode of 10, you must scan a 1 then 0, then scan the maximum barcode again.

Factory Default

Use the **Factory Default** barcode to reset the scanner to the Default settings.

|||||||||||| **Factory Default** barcode

Factory Default

Auto-Sense Stand Mode

Scan the Auto-Sense Stand Mode barcode to enable the hands-free autosense feature of the WLR8950 Scanners. If you desire to turn this mode "off," scan the Trigger Only barcode.

Auto-Sense Mode Enable   **Trigger Only**

Magnetic Switch is available after activating Auto-Sense Stand Mode.

- The Magnetic Switch is automatically activated when Auto-Sensing Mode is on.
- To enable Magnetic Switch, the scanner should be paired with an Auto-Sense Stand to perform the Auto-Sensing function.
- When Magnetic Switch is disabled, the scanner will perform the Auto-Sensing function without an Auto-Sense Stand.

Magnetic Switch On   **Magnetic Switch Off**

Keyboard Connection

The Keyboard Connection is used to program the Wasp WLR8950 Scanners for the type of computer to which it is attached.

PC (USB or PS/2) *   **Notebook**

Interface Selections

The Interface Selections barcodes allow you to switch interfaces based on your connection type.

The scanner is designed to switch easily between interface options. To switch from one interface to another, the appropriate cable must be installed. After changing to a new cable, be sure to reset the interface setting.

USB KB

PS2

*Default

The 'Beep and Delay' configuration supports the general control options for the Wasp WLR8950 Scanners. These options include the tone, intercharacter delay, and interblock delay.   The High, Low and Med settings refer to the tone of the beep, not the volume.

Interblock delay is the minimum time interval between two adjacent scans. If the processing speed of your host device is slower than your scanning speed, a longer interblock delay may ensure the data integrity.

Intercharacter delay is the time period that the scanner will wait before transmitting the next character. If data sent by the scanner has incorrect or missing characters, a longer intercharacter delay may solve the problem. The intercharacter delay should be changed only if the transfer rate cannot be maintained between the scanner and the keyboard buffer of the computer.

Note: The default for the intercharacter delay is set to '140us' and is the most common configuration; however, your PC may be different. When you scan a barcode, if some stray or scrambled characters appear, increase the intercharacter delay to slow down the transfer rate.

Upper/Lower Case

- Caps Lock Auto (For PC XT/AT only):
  In Auto Trace mode, the scanner will keep track of the Caps Lock status automatically. For some PCs, the scanning performance may be compromised because of the auto tracing. If the scanning performance is poor (or cannot scan) or the scanner cannot output the upper/lower case characters correctly, try to select one of the next two choices instead of auto tracing.
- Caps Lock Off:
  When the keyboard is in the unshifted state (Caps Lock is not pressed), select "Lower Case."
- Caps Lock On:
  When the keyboard is in the shifted state (Caps Lock is on),
  select "Upper Case."

Preamble/Postamble

The 'Preamble/Postamble' configuration is used to add a prefix or suffix set of characters to the barcode value. Up to 8 characters may be added for each option separately. Preamble and postamble characters can function concurrently, but need to be configured separately.

To add preamble or postamble characters, follow the steps below:

1) Scan the 'Clear Pre/Postamble' barcode on this page.
2) Scan the 'Preamble' or 'Postamble' barcode.
3) Use Appendix B on pages 27-30 to locate the characters you want to add as preamble or postamble characters. Make sure that you scan the barcode associated with each letter before preceding to the next character. For example, to add the letter "A," scan the barcode corresponding to the letter "A". The letter "A" will always appear in your data as prefix or suffix to the barcode value.
4) Scan the corresponding 'Pre/Postamble' barcode on this page to exit this setting.

Clear Pre/Postamble   **Postamble**   **Preamble**

Terminator

The 'Terminator' option is used to specify the end-of-text message and is primarily used to denote the end of the barcode value.

Code 39 is variable length and is the most frequently used symbology in industrial barcode systems today. It is extensively used within the Department of Defense (DOD). The principal feature is to encode messages using the full alphanumeric character set. Standard Code 39 contains only 43 characters (0-9, A-Z, $, /, %, +, -, ., SPACE) and can be extended to a 128 character symbology (full ASCII) by combining one of the special characters (S, /, %, +) with a letter (A-Z) to form the characters that are not present in the standard Code 39 symbology.

See page 5 for information on setting the minimum and maximum lengths.

Minimum Length (1 *)

Maximum Length (48 *)

Interleaved 2 of 5 is a variable length, even numbered, numeric barcode.

It is typically used in industrial and master carton labeling and also in the automobile industry. The symbology uses bars to represent the first digit of a pair and the interleaved (white) spaces to represent the second digit of a character pair.

See page 5 for information on setting the minimum and maximum lengths.

*Default

MSI Plessey is a variable length numeric symbology and is primarily used in marking retail shelves. Each character consists of four bars with intervening spaces for each encoded digit, one or two symbol check digits, and a reverse start code.

See page 5 for information on setting the minimum and maximum lengths.

Codabar is a variable length symbology capable of encoding six special alphanumeric characters, capital letters A through D, T, N, *, E, and all numeric digits. Codabar is one of the oldest barcode symbologies and is still used in some library applications. It should not be considered for new applications except under unusual circumstances.

UPC-A (Universal Product Code-A) is fixed length and is the most common UPC barcode for retail product labeling. It is seen in most grocery stores across the United States. The symbology encodes a 12-digit number. The first six digits are assigned from the Uniform Code Council (UCC). The next five digits are assigned by the manufacturer, and the final digit is a modulo 10 check digit. The nominal height for the UPC-A barcode is one inch. The reduced size is 80% of the nominal size.

Wasp Barcode Technologies products are warranted against defects in workmanship and materials for a period of one year from the date of shipment, provided that the product remains unmodified and is operated under normal and proper conditions.

This warranty is limited to repair or replacement at Wasp Barcode Technologies option, with reasonable promptness after being notified. These provisions do not prolong the original warranty term for any product which has been repaired or replaced by Wasp Barcode Technologies.

This warranty applies to the original owner and does not extend to any product which has been subject to misuse, neglect, accidental damage, unauthorized repair, or tampering.

No other express warranty is given. The replacement or repair of a product is your exclusive remedy. Any other implied warranty of merchantability or fitness is limited to the duration of this written warranty. Some states, provinces, and countries do not allow limits on how long an implied warranty lasts, so the above limitation may not apply to you.

In no event shall Wasp Barcode Technologies be liable for consequential damages. Some states, provinces, and countries do not allow the exclusion or limitation of incidental or consequential damages, so the above limitations may not apply to you.

Q: How do I configure the scanner for a notebook (or laptop) computer?
A: Scan the "Notebook" barcode on page 8.

Q: How do I change the terminator to a Tab?
A: Scan the "Tab" barcode on page 12.

Q: How do I remove the terminator?
A: Scan the "None" barcode on page 12.

Q: How do I enable the Full ASCII character set for the Code 39 barcode symbology?
   A: Scan the following "Enable Code 39 Full ASCII" bar code on page 15.

If you experience any problems with the Wasp WLR8950 Series Scanners that you are unable to resolve, call for technical assistance at (214) 547-4100 ext 2, Monday through Friday, 8:00 AM - 5:00 PM Central Standard Time. Visit www.waspbarcode.com/support anytime.
