Abstract

This document is for the person who installs, administers, and troubleshoots servers and storage systems. Hewlett Packard Enterprise assumes you are qualified in the servicing of computer equipment and trained in recognizing hazards in products with hazardous energy levels.

*When all four LEDs described in this table flash simultaneously, a power fault has occurred. For more information, see "Power fault LEDs (on page 10)."

**Facility power is not present, power cord is not attached, no power supplies are installed, power supply failure has occurred, or the power button cable is disconnected.

†To identify components in a degraded or critical state, see the Systems Insight Display LEDs, check iLO/BIOS logs, and reference the server troubleshooting guide.

UID button functionality

The UID button can be used to display the HPE ProLiant Pre-boot Health Summary when the server will not power on. For more information, see the HPE iLO 4 User Guide on the Hewlett Packard Enterprise website (http://www.hpe.com/info/ilo/docs).
Power fault LEDs

The following table provides a list of power fault LEDs, and the subsystems that are affected. Not all power faults are used by all servers.

<table>

Systems Insight Display LEDs

The Systems Insight Display LEDs represent the system board layout. The display provides status for all internal LEDs and enables diagnosis with the access panel installed. To view the LEDs, access the Systems Insight Display.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
## Systems Insight Display LED combinations

When the health LED on the front panel illuminates either amber or red, the server is experiencing a health event. Combinations of illuminated Systems Insight Display LEDs, the system power LED, and the health LED indicate system status.

<table>

</table>

#### Power supply (amber)

<table>
<thead>
<tr>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amber</td>
</tr>
</tbody>
</table>

One or more of the following conditions may exist:

- Redundant power supply is installed and only one power supply is functional.
- AC power cord is not plugged into redundant power supply.
- Redundant power supply fault
- Power supply mismatch at POST or power supply mismatch through hot-plug addition

#### Power cap (off)

<table>
<thead>
<tr>

</tbody>
</table>

**Power is available.**

#### Power cap (flashing amber)

<table>
<thead>
<tr>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amber</td>
</tr>
</tbody>
</table>

**Power is not available.**

---

**IMPORTANT:** If more than one DIMM slot LED is illuminated, further troubleshooting is required. Test each bank of DIMMs by removing all other DIMMs. Isolate the failed DIMM by replacing each DIMM in a bank with a known working DIMM.

---

</tr>
<tr>
<td>S11</td>
<td>—</td>
<td>Reserved</td>
</tr>
<tr>
<td>S12</td>
<td>—</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

*To access the redundant ROM, set S1, S5, and S6 to On.**When the system maintenance switch position 6 is set to the On position, the system is prepared to restore all configuration settings to their manufacturing defaults. When the system maintenance switch position 6 is set to the On position and Secure Boot is enabled, some configurations cannot be restored. For more information, see Secure Boot configuration (on page 123).

**IMPORTANT:** Before using the S7 switch to change to Legacy BIOS Boot Mode, be sure the HPE Dynamic Smart Array B140i Controller is disabled. Do not use the B140i controller when the server is in Legacy BIOS Boot Mode.

## NMI jumper

The NMI jumper allows administrators to perform a memory dump before performing a hard reset. Crash dump analysis is an essential part of eliminating reliability problems, such as hangs or crashes in OSs, device drivers, and applications. Many crashes can freeze a system, requiring you to do a hard reset. Resetting the system erases any information that would support root cause analysis.

Systems running Microsoft® Windows® experience a blue-screen trap when the OS crashes. When this happens, Microsoft® recommends that system administrators perform an NMI event by temporarily shorting the NMI header with a jumper. The NMI event enables a hung system to become responsive again.
**DIMM slots**

DIMM slots are numbered sequentially (1 through 12) for each processor. The supported AMP modes use the letter assignments for population guidelines.

**Non-hot-plug PCI riser board slot definitions**

<table>
<thead>
<tr>
<th>Primary riser cage connector, connected to processor 1 or the southbridge</th>
<th>PCIe 3-slot riser cage</th>
<th>PCIe 2-slot x16 riser cage*</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - 3/4L/FH</td>
<td>PCIe3 x16 (16, 8,4,2,1)</td>
<td>PCIe3 x16 (16,8,4,2,1)</td>
</tr>
<tr>
<td>2 - LP</td>
<td>PCIe3 x8 (8,4,2,1)</td>
<td>PCIe3* x8 (8,4,2,1)</td>
</tr>
<tr>
<td>3 - LP/3/4L/FH</td>
<td>PCIe3 x16 (16, 8,4,2,1)**</td>
<td>—</td>
</tr>
</tbody>
</table>

*The server ships with one PCIe3 riser cage installed in the primary riser cage connector.

**The x16 PCIe3 riser cage is optional and can be converted to a FH riser. This conversion requires a second processor to be installed.

Notes:

- "Primary" denotes the riser cage is installed in the primary riser connector.
- "Secondary" denotes the riser cage is installed in the secondary riser connector.
- Installing the riser cages listed in the table above in either the primary or secondary riser connectors determines the form factor of the PCI cards supported by those riser cages.
- FL/FH denotes full-length, full-height. HL/FH denotes half-length, full-height. LP denotes low profile.

Device numbers
- 4LFF configuration

With the 10SFF (6 NVMe + 4 SAS/SATA) Express Bay Enablement Option, the server supports SAS, SATA, and PCIe-based NVMe drives in the following locations:
  - Bays 1 through 4 support SFF SAS and SATA drives only
Bays 5 through 10 support SFF PCIe-based NVMe drives only

Hot-plug SATA/SAS drive LED definitions

NVMe SSD components

The NVMe SSD is a PCIe bus device. A device attached to a PCIe bus cannot be removed without allowing the device and bus to complete and cease the signal/traffic flow.

⚠️ **CAUTION:** Do not remove an NVMe SSD from the drive bay while the Do Not Remove button LED is flashing. The Do Not Remove button LED flashes to indicate the device is still in use. Removal of the NVMe SSD before the device has completed and ceased signal/traffic flow can cause loss of data.

**Hot-plug fans**

⚠️ **CAUTION:** To avoid damage to server components, fan blanks must be installed in fan bays 1 and 2 in a single-processor configuration.

The only two valid fan configurations are listed in the following table.

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Fan bay 1</th>
<th>Fan bay 2</th>
<th>Fan bay 3</th>
<th>Fan bay 4</th>
<th>Fan bay 5</th>

<td>Fan</td>
<td>Fan</td>
<td>Fan</td>
<td>Fan</td>
<td>Fan</td>
<td>Fan</td>
</tr>
</tbody>
</table>

For a single-processor configuration, five fans and two blanks are required in specific fan bays for redundancy.
For a dual-processor configuration, seven fans are required for redundancy. A fan failure or missing fan causes a loss of redundancy. A second fan failure or missing fan causes an orderly shutdown of the server.

The high performance fan option might be necessary for the following installations:

- LR DIMM configuration
- ASHRAE compliant configurations
  
  For more information, see the Hewlett Packard Enterprise website (http://www.hpe.com/servers/ASHRAE).

The server supports variable fan speeds. The fans operate at minimum speed until a temperature change requires a fan speed increase to cool the server. The server shuts down during the following temperature-related scenarios:

- At POST and in the OS, iLO 4 performs an orderly shutdown if a cautionary temperature level is detected. If the server hardware detects a critical temperature level before an orderly shutdown occurs, the server performs an immediate shutdown.

- When the Thermal Shutdown feature is disabled in RBSU, iLO 4 does not perform an orderly shutdown when a cautionary temperature level is detected. Disabling this feature does not disable the server hardware from performing an immediate shutdown when a critical temperature level is detected.

⚠️ **CAUTION:** A thermal event can damage server components when the Thermal Shutdown feature is disabled in RBSU.
Operations

Powering up the server

To power up the server, press the Power On/Standby button.

Power down the server

Before powering down the server for any upgrade or maintenance procedures, perform a backup of critical server data and programs.

**IMPORTANT:** When the server is in standby mode, auxiliary power is still being provided to the system.

To power down the server, use one of the following methods:

- Press and release the Power On/Standby button.
  This method initiates a controlled shutdown of applications and the OS before the server enters standby mode.
- Press and hold the Power On/Standby button for more than 4 seconds to force the server to enter standby mode.
  This method forces the server to enter standby mode without properly exiting applications and the OS. If an application stops responding, you can use this method to force a shutdown.
- Use a virtual power button selection through iLO 4.
  This method initiates a controlled remote shutdown of applications and the OS before the server enters standby mode.

Before proceeding, verify the server is in standby mode by observing that the system power LED is amber.

Extend the server from the rack

**NOTE:** If the optional cable management arm option is installed, you can extend the server without powering down the server or disconnecting peripheral cables and power cords. These steps are only necessary with the standard cable management solution.

1. Power down the server (on page 21).
2. Disconnect all peripheral cables and power cords.
3. Loosen the front panel thumbscrews.
4. Extend the server on the rack rails until the server rail-release latches engage.

**WARNING:** To reduce the risk of personal injury or equipment damage, be sure that the rack is adequately stabilized before extending a component from the rack.

**WARNING:** To reduce the risk of personal injury, be careful when pressing the server rail-release latches and sliding the server into the rack. The sliding rails could pinch your fingers.

5. After performing the installation or maintenance procedure, slide the server into the rack:
6. Connect the peripheral cables and power cords.

Remove the server from the rack

To remove the server from a Hewlett Packard Enterprise, Compaq-branded, Telco, or third-party rack:
1. Power down the server (on page 21).
2. Extend the server from the rack (on page 21).
3. Disconnect the cabling and remove the server from the rack. For more information, see the documentation that ships with the rack mounting option.
4. Place the server on a sturdy, level surface.

Remove the access panel

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** Do not operate the server for long periods with the access panel open or removed. Operating the server in this manner results in improper airflow and improper cooling that can lead to thermal damage.

To remove the component:
1. Power down the server (on page 21).
2. Extend the server from the rack (on page 21).
3. Open or unlock the locking latch, slide the access panel to the rear of the chassis, and remove the access panel.

Install the access panel

1. Place the access panel on top of the server with the hood latch open. Allow the panel to extend past the rear of the server approximately 1.25 cm (0.5 in).
2. Push down on the hood latch. The access panel slides to a closed position.
3. Tighten the security screw on the hood latch.

Remove the hot-plug fan

To remove the component:
1. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
2. Remove the access panel (on page 22).
3. Remove the fan.

CAUTION: Do not operate the server for long periods with the access panel open or removed. Operating the server in this manner results in improper airflow and improper cooling that can lead to thermal damage.

IMPORTANT: For optimum cooling, install fans in all primary fan locations. For more information, refer to the fan locations table.

To replace the component, reverse the removal procedure.

Remove the PCI riser cage

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   o Extend the server from the rack (on page 21).
4. Remove the access panel (on page 22).
5. Remove the PCI riser cage.

Install the PCI riser cage

1. Install the PCI riser cage.

2. Install the access panel (on page 22).
3. Install the server into the rack.
4. Connect each power cord to the server.
5. Connect each power cord to the power source.
6. Power up the server ("Powering up the server" on page 21).
Removing the 8 SFF drive backplane

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove all drives ("Removing a hot-plug SAS or SATA drive" on page 50).
6. Remove all drive blanks ("Removing the hard drive blank" on page 49).
7. Disconnect and remove all cables connected to the drive backplane.
8. Remove the 8SFF SAS/SATA drive backplane.
Setup

Optional services

Delivered by experienced, certified engineers, HPE support services help you keep your servers up and running with support packages tailored specifically for HPE ProLiant systems. HPE support services let you integrate both hardware and software support into a single package. A number of service level options are available to meet your business and IT needs.

HPE support services offer upgraded service levels to expand the standard product warranty with easy-to-buy, easy-to-use support packages that will help you make the most of your server investments. Some of the HPE support services for hardware, software or both are:

- **Foundation Care** – Keep systems running.
  - 6-Hour Call-to-Repair
  - 4-Hour 24x7
  - Next Business Day

- **Proactive Care** – Help prevent service incidents and get you to technical experts when there is one.
  - 6-Hour Call-to-Repair
  - 4-Hour 24x7
  - Next Business Day

- **Startup and implementation services** for both hardware and software

- **HPE Education Services** – Help train your IT staff.

For more information on HPE support services, see the Hewlett Packard Enterprise website ([http://www.hpe.com/services](http://www.hpe.com/services)).

Optimum environment

When installing the server in a rack, select a location that meets the environmental standards described in this section.

Space and airflow requirements

To allow for servicing and adequate airflow, observe the following space and airflow requirements when deciding where to install a rack:

- Leave a minimum clearance of 85.09 cm (33.5 in) in front of the rack.
- Leave a minimum clearance of 76.2 cm (30 in) behind the rack.
- Leave a minimum clearance of 121.9 cm (48 in) from the back of the rack to the back of another rack or row of racks.

Hewlett Packard Enterprise servers draw in cool air through the front door and expel warm air through the rear door. Therefore, the front and rear rack doors must be adequately ventilated to allow ambient room air to enter the cabinet, and the rear door must be adequately ventilated to allow the warm air to escape from the cabinet.
CAUTION: To prevent improper cooling and damage to the equipment, do not block the ventilation openings.

When vertical space in the rack is not filled by a server or rack component, the gaps between the components cause changes in airflow through the rack and across the servers. Cover all gaps with blanking panels to maintain proper airflow.

CAUTION: Always use blanking panels to fill empty vertical spaces in the rack. This arrangement ensures proper airflow. Using a rack without blanking panels results in improper cooling that can lead to thermal damage.

The 9000 and 10000 Series Racks provide proper server cooling from flow-through perforations in the front and rear doors that provide 64 percent open area for ventilation.

CAUTION: When using a Compaq branded 7000 series rack, install the high airflow rack door insert (PN 327281-B21 for 42U rack, PN 157847-B21 for 22U rack) to provide proper front-to-back airflow and cooling.

CAUTION: If a third-party rack is used, observe the following additional requirements to ensure adequate airflow and to prevent damage to the equipment:
- Front and rear doors—If the 42U rack includes closing front and rear doors, you must allow 5,350 sq cm (830 sq in) of holes evenly distributed from top to bottom to permit adequate airflow (equivalent to the required 64 percent open area for ventilation).
- Side—The clearance between the installed rack component and the side panels of the rack must be a minimum of 7 cm (2.75 in).

Temperature requirements

To ensure continued safe and reliable equipment operation, install or position the system in a well-ventilated, climate-controlled environment.

The maximum recommended ambient operating temperature (TMRA) for most server products is 35°C (95°F). The temperature in the room where the rack is located must not exceed 35°C (95°F).

For information on ambient operating temperature support above 35°C, see the Hewlett Packard Enterprise website (http://www.hpe.com/servers/ASHRAE).

CAUTION: To reduce the risk of damage to the equipment when installing third-party options:
- Do not permit optional equipment to impede airflow around the server or to increase the internal rack temperature beyond the maximum allowable limits.
- Do not exceed the manufacturer's TMRA.

Power requirements

Installation of this equipment must comply with local and regional electrical regulations governing the installation of information technology equipment by licensed electricians. This equipment is designed to operate in installations covered by NFPA 70, 1999 Edition (National Electric Code) and NFPA-75, 1992 (code for Protection of Electronic Computer/Data Processing Equipment). For electrical power ratings on options, refer to the product rating label or the user documentation supplied with that option.

WARNING: To reduce the risk of personal injury, fire, or damage to the equipment, do not overload the AC supply branch circuit that provides power to the rack. Consult the electrical authority having jurisdiction over wiring and installation requirements of your facility.
**CAUTION:** Protect the server from power fluctuations and temporary interruptions with a regulating uninterruptible power supply. This device protects the hardware from damage caused by power surges and voltage spikes and keeps the system in operation during a power failure.

When installing more than one server, you might need to use additional power distribution devices to safely provide power to all devices. Observe the following guidelines:

- Balance the server power load between available AC supply branch circuits.
- Do not allow the overall system AC current load to exceed 80% of the branch circuit AC current rating.
- Do not use common power outlet strips for this equipment.
- Provide a separate electrical circuit for the server.

For more information on the hot-plug power supply and calculators to determine server power consumption in various system configurations, see the Hewlett Packard Enterprise Power Advisor website ([http://www.hpe.com/info/poweradvisor/online](http://www.hpe.com/info/poweradvisor/online)).

**Electrical grounding requirements**

The server must be grounded properly for proper operation and safety. In the United States, you must install the equipment in accordance with NFPA 70, 1999 Edition (National Electric Code), Article 250, as well as any local and regional building codes. In Canada, you must install the equipment in accordance with Canadian Standards Association, CSA C22.1, Canadian Electrical Code. In all other countries, you must install the equipment in accordance with any regional or national electrical wiring codes, such as the International Electrotechnical Commission (IEC) Code 364, parts 1 through 7. Furthermore, you must be sure that all power distribution devices used in the installation, such as branch wiring and receptacles, are listed or certified grounding-type devices.

Because of the high ground-leakage currents associated with multiple servers connected to the same power source, Hewlett Packard Enterprise recommends the use of a PDU that is either permanently wired to the building’s branch circuit or includes a nondetachable cord that is wired to an industrial-style plug. NEMA locking-style plugs or those complying with IEC 60309 are considered suitable for this purpose. Using common power outlet strips for the server is not recommended.

**Connecting a DC power cable to a DC power source**

**WARNING:** To reduce the risk of electric shock or energy hazards:

- This equipment must be installed by trained service personnel, as defined by the NEC and IEC 60950-1, Second Edition, the standard for Safety of Information Technology Equipment.
- Connect the equipment to a reliably grounded Secondary circuit source. A Secondary circuit has no direct connection to a Primary circuit and derives its power from a transformer, converter, or equivalent isolation device.
- The branch circuit overcurrent protection must be rated 27 A.

**WARNING:** When installing a DC power supply, the ground wire must be connected before the positive or negative leads.

**WARNING:** Remove power from the power supply before performing any installation steps or maintenance on the power supply.

**CAUTION:** The server equipment connects the earthed conductor of the DC supply circuit to the earthing conductor at the equipment. For more information, see the documentation that ships with the power supply.
CAUTION: If the DC connection exists between the earthed conductor of the DC supply circuit and the earthing conductor at the server equipment, the following conditions must be met:

- This equipment must be connected directly to the DC supply system earthing electrode conductor or to a bonding jumper from an earthing terminal bar or bus to which the DC supply system earthing electrode conductor is connected.
- This equipment should be located in the same immediate area (such as adjacent cabinets) as any other equipment that has a connection between the earthed conductor of the same DC supply circuit and the earthing conductor, and also the point of earthing of the DC system. The DC system should be earthed elsewhere.
- The DC supply source is to be located within the same premises as the equipment.
- Switching or disconnecting devices should not be in the earthed circuit conductor between the DC source and the point of connection of the earthing electrode conductor.

To connect a DC power cable to a DC power source:

1. Cut the DC power cord ends no shorter than 150 cm (59.06 in).
2. If the power source requires ring tongues, use a crimping tool to install the ring tongues on the power cord wires.

   **IMPORTANT:** The ring terminals must be UL approved and accommodate 12 gauge wires.

   **IMPORTANT:** The minimum nominal thread diameter of a pillar or stud type terminal must be 3.5 mm (0.138 in); the diameter of a screw type terminal must be 4.0 mm (0.157 in).

3. Stack each same-colored pair of wires and then attach them to the same power source. The power cord consists of three wires (black, red, and green).

   For more information, see the documentation that ships with the power supply.

### Rack warnings

**WARNING:** To reduce the risk of personal injury or damage to the equipment, be sure that:

- The leveling jacks are extended to the floor.
- The full weight of the rack rests on the leveling jacks.
- The stabilizing feet are attached to the rack if it is a single-rack installation.
- The racks are coupled together in multiple-rack installations.
- Only one component is extended at a time. A rack may become unstable if more than one component is extended for any reason.

**WARNING:** To reduce the risk of personal injury or equipment damage when unloading a rack:

- At least two people are needed to safely unload the rack from the pallet. An empty 42U rack can weigh as much as 115 kg (253 lb), can stand more than 2.1 m (7 ft) tall, and might become unstable when being moved on its casters.
- Never stand in front of the rack when it is rolling down the ramp from the pallet. Always handle the rack from both sides.

### Identifying the contents of the server shipping carton

Unpack the server shipping carton and locate the materials and documentation necessary for installing the server. All the rack mounting hardware necessary for installing the server into the rack is included with the rack or the server.

The contents of the server shipping carton include:
• Server
• Power cord
• Hardware documentation and software products
• Rack-mounting hardware and documentation

In addition to the supplied items, you might need:
• Operating system or application software
• Hardware options
• Screwdriver

Installing hardware options

Install any hardware options before initializing the server. For options installation information, refer to the option documentation. For server-specific information, refer to “Hardware options installation (on page 33).”

Installing the server into the rack

To install the server into a rack with square, round, or threaded holes, refer to the instructions that ship with the rack hardware kit.

If you are installing the server into a telco rack, order the appropriate option kit at the RackSolutions.com website (http://www.racksolutions.com/hp). Follow the server-specific instructions on the website to install the rack brackets.

Use the following information when connecting peripheral cables and power cords to the server.

⚠️ **WARNING:** This server is very heavy. To reduce the risk of personal injury or damage to the equipment:

- Observe local occupational health and safety requirements and guidelines for manual material handling.
- Get help to lift and stabilize the product during installation or removal, especially when the product is not fastened to the rails. Hewlett Packard Enterprise recommends that a minimum of two people are required for all rack server installations. A third person may be required to help align the server if the server is installed higher than chest level.
- Use caution when installing the server in or removing the server from the rack; it is unstable when not fastened to the rails.

⚠️ **CAUTION:** Always plan the rack installation so that the heaviest item is on the bottom of the rack. Install the heaviest item first, and continue to populate the rack from the bottom to the top.

1. Install the server and cable management arm into the rack. See the installation instructions that ship with the selected rail system.
2. Connect the peripheral devices to the server.

*The slot 3 PCIe 3 riser is optional and requires a second processor before installation.

3. Connect the power cord to the server.
4. Use the hook-and-loop strap to secure the power cord.
5. Connect the power cord to the power source.

### Powering on and selecting boot options in UEFI Boot Mode

On servers operating in UEFI Boot Mode, the boot controller and boot order are set automatically.

1. Press the Power On/Standby button.
2. During the initial boot:
To modify the server configuration ROM default settings, press the F9 key in the ProLiant POST screen to enter the UEFI System Utilities screen. By default, the System Utilities menus are in the English language.

- If you do not need to modify the server configuration and are ready to install the system software, press the F10 key to access Intelligent Provisioning.

For more information on automatic configuration, see the UEFI documentation on the Hewlett Packard Enterprise website (http://www.hpe.com/info/ProLiantUEFI/docs).

Installing the operating system

This ProLiant server does not ship with provisioning media. Everything needed to manage and install the system software and firmware is preloaded on the server.

To operate properly, the server must have a supported operating system. Attempting to run an unsupported operating system can cause serious and unpredictable results. For the latest information on operating system support, see the Hewlett Packard Enterprise website (http://www.hpe.com/info/supportos).

Failure to observe UEFI requirements for ProLiant Gen9 servers can result in errors installing the operating system, failure to recognize boot media, and other boot failures. For more information on these requirements, see the HPE UEFI Requirements on the Hewlett Packard Enterprise website (http://www.hpe.com/info/ProLiantUEFI/docs).

To install an operating system on the server, use one of the following methods:

- Intelligent Provisioning—For single-server deployment, updating, and provisioning capabilities.
  
  To install an operating system on the server with Intelligent Provisioning (local or remote):
  
  a. Connect the Ethernet cable between the network connector on the server and a network jack.
  
  b. Press the Power On/Standby button.
  
  c. During server POST, press F10.
  
  d. Complete the initial Preferences and Registration portion of Intelligent Provisioning (on page 120).
  
  e. At the 1 Start screen, click Configure and Install.
  
  f. To finish the installation, follow the onscreen prompts. An Internet connection is required to update the firmware and systems software.

- Insight Control server provisioning—For multi-server remote OS deployment, use Insight Control server provisioning for an automated solution. For more information, see the Insight Control documentation on the Hewlett Packard Enterprise website (http://www.hpe.com/info/insightcontrol/docs).

For additional system software and firmware updates, download the Service Pack for ProLiant from the Hewlett Packard Enterprise website (http://www.hpe.com/servers/spp/download). Software and firmware must be updated before using the server for the first time, unless any installed software or components require an older version.

For more information, see “Keeping the system current (on page 127).”

For more information on using these installation methods, see the Hewlett Packard Enterprise website (http://www.hpe.com/info/ilo).

Registering the product

To experience quicker service and more efficient support, register the product at the Hewlett Packard Enterprise Product Registration website (http://www.hpe.com/info/register).
Hardware options installation

Introduction

If more than one option is being installed, read the installation instructions for all the hardware options and identify similar steps to streamline the installation process.

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause electrostatic discharge.

High-performance fan option

This kit is available to meet some extended ambient operating temperatures above 35 degrees Celsius. For more information about the qualifications for extended ambient configurations, see the Hewlett Packard Enterprise website ([http://www.hpe.com/servers/ASHRAE](http://www.hpe.com/servers/ASHRAE)).

To install the component:

1. Power down the server (on page 21).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).

🔍 **IMPORTANT:** Do not mix standard fans and high-performance fans in the same server.
5. Remove all standard fans from the fan bays.

6. Remove fan blanks from the fan bays, if installed.
7. Install high-performance fans in each of the 7 fan bays.

8. Install the access panel (on page 22).
9. Slide the server into the rack.
10. Connect each power cord to the server.
11. Connect each power cord to the power source.
12. Press the Power On/Standby button.
   The server exits standby mode and applies full power to the system. The system power LED changes from amber to green.

**Processor and fan option**

The server supports single-processor and dual-processor operations.

⚠️ CAUTION: To avoid damage to the processor and system board, only authorized personnel should attempt to replace or install the processor in this server.

⚠️ CAUTION: To prevent possible server malfunction and damage to the equipment, multiprocessor configurations must contain processors with the same part number.

⚠️ IMPORTANT: If installing a processor with a faster speed, update the system ROM before installing the processor.

To install the processor:
1. Power down the server (on page 21).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the processor blank.
6. Open each of the processor locking levers in the order indicated in the following illustration, and then open the processor retaining bracket.

![Diagram](image1)

7. Remove the clear processor socket cover. Retain the processor socket cover for future use.

![Diagram](image2)

⚠️ **CAUTION:** THE PINS ON THE SYSTEM BOARD ARE VERY FRAGILE AND EASILY DAMAGED. To avoid damage to the system board, do not touch the processor or the processor socket contacts.
8. Install the processor. Verify that the processor is fully seated in the processor retaining bracket by visually inspecting the processor installation guides on either side of the processor. **THE PINS ON THE SYSTEM BOARD ARE VERY FRAGILE AND EASILY DAMAGED.**

9. Close the processor retaining bracket. When the processor is installed properly inside the processor retaining bracket, the processor retaining bracket clears the flange on the front of the socket.

⚠️ **CAUTION:** Do not press down on the processor. Pressing down on the processor may cause damage to the processor socket and the system board. Press only in the area indicated on the processor retaining bracket.

10. Press and hold the processor retaining bracket in place, and then close each processor locking lever. Press only in the area indicated on the processor retaining bracket.
△ **CAUTION:** Close and hold down the processor cover socket while closing the processor locking levers. The levers should close without resistance. Forcing the levers closed can damage the processor and socket, requiring system board replacement.

11. Remove the heatsink cover.

△ **CAUTION:** After the cover is removed, do not touch the thermal interface media.

12. Install the heatsink:
   a. Position the heatsink on the processor backplate.
   b. Tighten one pair of diagonally opposite screws halfway, and then tighten the other pair of screws.
   c. Finish the installation by completely tightening the screws in the same sequence.
13. Remove the fan blanks from locations 1 and 2. For fan location and numbering information, see "Hot-plug fans (on page 19)" or the label attached to the chassis next to the fans.

14. Install the fans into locations 1 and 2.

**IMPORTANT:** Do not mix standard fans and high-performance fans in the same server.

15. Install the access panel (on page 22).

16. Install the server into the rack.

17. Connect each power cord to the server.

18. Connect each power cord to the power source.

19. Press the Power On/Standby button.

   The server exits standby mode and applies full power to the system. The system power LED changes from amber to green.
High performance heatsink

Although these heatsinks are required for certain processors, they can also be used to reduce fan power consumption with processors that only need standard-performance heatsinks.

Fan power savings varies by server configuration and workload and thus has been optimized to improve fan power in either high workloads, dense configurations, and/or extended ambient configurations.

For a list of processors that are compatible with these high-performance heatsinks, see the QuickSpecs on the Hewlett Packard Enterprise website (http://www.hpe.com/info/qs).

⚠️ WARNING: To reduce the risk of personal injury, electric shock, or damage to the equipment, remove the power cord to remove power from the server. The front panel Power On/Standby button does not completely shut off system power. Portions of the power supply and some internal circuitry remain active until AC power is removed.

To install the component:
1. Power down the server (on page 21).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the standard heatsinks.
6. Clean the old thermal grease from the processor with the alcohol swab. Allow the alcohol to evaporate before continuing.
7. Remove the heatsink cover.

8. Install the high-performance heatsinks.

9. Install the access panel (on page 22).

10. Install the server into the rack.

11. Connect each power cord to the server.

12. Connect each power cord to the power source.

13. Press the Power On/Standby button.

   The server exits standby mode and applies full power to the system. The system power LED changes from amber to green.

Memory options

**IMPORTANT:** This server does not support mixing LRDIMMs and RDIMMs. Attempting to mix any combination of these DIMMs can cause the server to halt during BIOS initialization.
The memory subsystem in this server can support LRDIMMs or RDIMMs:

- RDIMMs offer address parity protection.
- LRDIMMs support higher densities than single-rank and dual-rank RDIMMs. This support enables you to install higher capacity DIMMs, resulting in higher system capacities and higher bandwidth.

All types are referred to as DIMMs when the information applies to all types. When specified as LRDIMM or RDIMM, the information applies to that type only. All memory installed in the server must be of the same type.

### Memory-processor compatibility information

The server processor determines the type of DIMM that will be supported in the server.

For the latest memory configuration information, see the product QuickSpecs on the Hewlett Packard Enterprise website (http://www.hpe.com/info/qs).

#### DIMM type

- Intel Xeon E5-2600 v3 processors support:
  - Single-rank and dual-rank PC4-2133P (DDR4-2133) RDIMMs operating at up to 2133 MT/s
  - Dual- and quad-rank PC4-2133P (DDR4-2133) LRDIMMs operating at up to 2133 MT/s
- Intel Xeon E5-2600 v4 processors support:
  - Single-rank and dual-rank PC4-2400T (DDR4-2400) RDIMMs operating at up to 2400 MT/s
  - Dual-rank and quad-rank PC4-2400T (DDR4-2400) LRDIMMs operating at up to 2400 MT/s
  - Octal-rank PC4-2400U (DDR4-2400) LRDIMMs operating at up to 2400 MT/s

The operating memory speed is a function of the rated DIMM speed, DIMMs installed per channel, processor model, and the speed selected in the BIOS/Platform Configuration (RBSU) of the UEFI System Utilities.

Depending on the processor model, the number of DIMMs installed, and whether LRDIMMs or RDIMMs are installed, the memory clock speed can be reduced to 1866 MT/s.

**Maximum memory capacity**

The maximum memory capacity is a function of the DIMM capacity, number of installed DIMMs, memory type, and number of installed processors.

**Maximum memory capacity - Intel Xeon E5-2600 v3 processor installed**

For the latest memory configuration information, see the QuickSpecs on the Hewlett Packard Enterprise website ([http://www.hpe.com/info/q2](http://www.hpe.com/info/q2)).
SmartMemory

HPE SmartMemory has the capability to operate at higher operational speeds than originally designed for, actually exceeding the industry standard when installed in HPE ProLiant servers.

It utilizes proprietary software that simulates varied and extreme operating environments and conditions is used to unlock certain performance and high-efficiency features optimized for HPE ProLiant servers. HPE SmartMemory is equipped with advanced error detection technology monitors memory parameters to find defects that can cause performance degradation or significantly increase the probability of a non-recoverable memory condition. The power consumption rate of SmartMemory is up to 20 percent less compared to third-party memory or other OEMs’ memory.

Memory subsystem architecture

The memory subsystem in this server is divided into channels. Each processor supports four channels, and each channel supports three DIMM slots, as shown in the following table.

<table>
<thead>
<tr>
<th>Channel</th>
<th>Population order</th>
<th>Slot number</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

For the location of the slot numbers, see "DIMM slot locations ("DIMM slots" on page 16)."

This multi-channel architecture provides enhanced performance in Advanced ECC mode. This architecture also enables Online Spare Memory mode.

DIMM slots in this server are identified by number and by letter. Letters identify the population order. Slot numbers indicate the DIMM slot ID for spare replacement.

DIMM ranks

To understand and configure memory protection modes properly, an understanding of DIMM rank is helpful. Some DIMM configuration requirements are based on these classifications.

A single-rank DIMM has one set of memory chips that is accessed while writing to or reading from the memory. A dual-rank DIMM is similar to having two single-rank DIMMs on the same module, with only one rank accessible at a time. A quad-rank DIMM is, effectively, two dual-rank DIMMs on the same module. Only one rank is accessible at a time. The server memory control subsystem selects the proper rank within the DIMM when writing to or reading from the DIMM.

Dual- and quad-rank DIMMs provide the greatest capacity with the existing memory technology. For example, if current DRAM technology supports 8-GB single-rank DIMMs, a dual-rank DIMM would be 16 GB, and a quad-rank DIMM would be 32 GB, and an octal-rank LRDIMM would be 64 GB.

LRDIMMs are labeled as quad- and octal-rank DIMMs. There are four and eight ranks of DRAM on the DIMM, but the LRDIMM buffer creates an abstraction that allows the DIMM to appear as a logical dual-rank DIMM to the system. This is called Rank Multiplication. The LRDIMM buffer also isolates the electrical loading of the DRAM from the system to allow for faster operation. These two changes allow the
system to support up to three LRDIMMs per memory channel, providing for greater memory capacity and higher memory operating speed compared to quad-rank RDIMMs.

**DIMM identification**

To determine DIMM characteristics, see the label attached to the DIMM and refer to the following illustration and table.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
<th>Definition</th>
</tr>
</thead>
</table>
| 1    | Capacity    | 8 GB  
 16 GB  
 32 GB  
 64 GB  
 128 GB |
| 2    | Rank        | 1R = Single-rank \n 2R = Dual-rank \n 4R = Quad-rank \n 8R = Octal-rank |
| 3    | Data width on DRAM | x4 = 4-bit \n x8 = 8-bit |
| 4    | Memory generation | DDR4 |
| 5    | Maximum memory speed | 2133 MT/s \n 2400 MT/s |
| 6    | CAS latency | P=15-15-15 \n T=17-17-17 \n U=20-18-18 |
| 7    | DIMM type | R = RDIMM (registered) \n L = LRDIMM (load reduced) |

For more information about product features, specifications, options, configurations, and compatibility, see the product QuickSpecs on the Hewlett Packard Enterprise website (http://www.hpe.com/info/qspec).

**Memory configurations**

To optimize server availability, the server supports the following AMP modes:

- **Advanced ECC**—Provides up to 4-bit error correction. This mode is the default option for this server.
- **Online spare memory**—Provides protection against failing or degraded DIMMs. Certain memory is reserved as spare, and automatic failover to spare memory occurs when the system detects a DIMM that is degrading. This allows DIMMs that have a higher probability of receiving an uncorrectable memory error (which would result in system downtime) to be removed from operation.
• Mirrored memory—Provides maximum protection against failed DIMMs. Uncorrectable errors in one channel are corrected by the mirror channel.

Advanced Memory Protection options are configured in the BIOS/Platform Configuration (RBSU). If the requested AMP mode is not supported by the installed DIMM configuration, the server boots in Advanced ECC mode. For more information, see the HPE UEFI System Utilities User Guide for HPE ProLiant Gen9 Servers on the Hewlett Packard Enterprise website (http://www.hpe.com/info/ProLiantUEFI/docs).

Advanced ECC memory configuration

Advanced ECC memory is the default memory protection mode for this server. Standard ECC can correct single-bit memory errors and detect multi-bit memory errors. When multi-bit errors are detected using Standard ECC, the error is signaled to the server and causes the server to halt.

Advanced ECC protects the server against some multi-bit memory errors. Advanced ECC can correct both single-bit memory errors and 4-bit memory errors if all failed bits are on the same DRAM device on the DIMM.

Advanced ECC provides additional protection over Standard ECC because it is possible to correct certain memory errors that would otherwise be uncorrected and result in a server failure. Using HPE Advanced Memory Error Detection technology, the server provides notification when a DIMM is degrading and has a higher probability of uncorrectable memory error.

Online Spare memory configuration

Online spare memory provides protection against degraded DIMMs by reducing the likelihood of uncorrected memory errors. This protection is available without any operating system support.

Online spare memory protection dedicates one rank of each memory channel for use as spare memory. The remaining ranks are available for OS and application use. If correctable memory errors occur at a rate higher than a specific threshold on any of the non-spare ranks, the server automatically copies the memory contents of the degraded rank to the online spare rank. The server then deactivates the failing rank and automatically switches over to the online spare rank.

Mirrored memory configuration

Mirroring provides protection against uncorrected memory errors that would otherwise result in server downtime. Mirroring is performed at the channel level to one memory channel pair that can be either:

• Channel 1 data being mirrored in channel 2
• Channel 3 data being mirrored in channel 4

If an uncorrectable error is detected in the active memory channel, data is retrieved from the mirror channel. This channel becomes the new active channel, and the system disables the channel with the failed DIMM.

General DIMM slot population guidelines

Observe the following guidelines for all AMP modes:

• Install DIMMs only if the corresponding processor is installed.
• When two processors are installed, balance the DIMMs across the two processors.
• White DIMM slots denote the first slot of a channel (Ch 1-A, Ch 2-B, Ch 3-C, Ch 4-D)
• Do not mix RDIMMs and LRDIMMs.
• When one processor is installed, install DIMMs in sequential alphabetic order: A, B, C, D, E, F, and so forth.
• When two processors are installed, install the DIMMs in sequential alphabetic order balanced between the two processors: P1-A, P2-A, P1-B, P2-B, P1-C, P2-C, and so forth.
• When single-rank, dual-rank, and quad-rank DIMMs are populated for two DIMMs per channel or three DIMMs per channel, always populate the higher number rank DIMM first (starting from the farthest slot). For example, first quad-rank DIMM, then dual-rank DIMM, and then lastly single-rank DIMM.
• DIMMs should be populated starting farthest from the processor on each channel.
• For DIMM spare replacement, install the DIMMs per slot number as instructed by the system software.

For more information about server memory, see the Hewlett Packard Enterprise website (http://www.hpe.com/info/memory).

Advanced ECC population guidelines
For Advanced ECC mode configurations, observe the following guidelines:
• Observe the general DIMM slot population guidelines (on page 46).
• DIMMs may be installed individually.

Online spare population guidelines
For Online Spare memory mode configurations, observe the following guidelines:
• Observe the general DIMM slot population guidelines (on page 46).
• Each channel must have a valid online spare configuration.
• Each channel can have a different valid online spare configuration.
• Each populated channel must have a spare rank. A single dual-rank DIMM is not a valid configuration.

Population order
For memory configurations with a single processor or multiple processors, DIMMs must be populated sequentially in alphabetical order (A through L).

After installing the DIMMs, use the BIOS/Platform Configuration (RBSU) in the UEFI System Utilities to configure supported AMP modes.

Mirrored Memory population guidelines
For Mirrored Memory mode configurations, observe the following guidelines:
• Observe the general DIMM slot population guidelines (on page 46).
• Install DIMMs in either channel 1 and channel 2, or channel 3 and channel 4. Installed DIMMs must be identical in terms of size and organization.
• In multi-processor configurations, each processor must have a valid Mirrored Memory configuration.

Identifying the processor type
The processor type installed in the server is briefly displayed during POST. To view this information and additional processor specifications, do the following:
1. Reboot the server.
   The server restarts and the POST screen appears.
2. Press **F9**.
   The System Utilities screen appears.
3. Select **System Information | Processor Information**.
   The Processor Information screen shows detailed information about the processors installed in the server.
4. Press **Esc** until the main menu is displayed.
5. Select **Reboot the System** to exit the utility and resume the boot process.

**Installing a DIMM**

The server supports up to 24 DIMMs.

To install a DIMM:

1. Power down the server (on page 21).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the air baffle.
6. Open the DIMM slot latches.
7. Install the DIMM.

8. Install the air baffle.
9. Install the access panel (on page 22).
10. Install the server into the rack.
11. Connect each power cord to the server.
12. Connect each power cord to the power source.
13. Power up the server ("Powering up the server" on page 21).
Use the BIOS/Platform Configuration (RBSU) in the UEFI System Utilities to configure the memory mode. For more information about LEDs and troubleshooting failed DIMMs, see "Systems Insight Display LED combinations (on page 11)."

Drive options

Depending on the configuration, this server supports SAS, SATA, and NVMe drives. For more information on drive support, see "Device bay numbering ("Device numbers" on page 17)."

When adding hard drives to the server, observe the following general guidelines:

- The system automatically sets all device numbers.
- If only one hard drive is used, install it in the bay with the lowest device number.
- Drives should be the same capacity to provide the greatest storage space efficiency when drives are grouped together into the same drive array.

Removing the hard drive blank

Remove the component as indicated.

Installing a hot-plug SAS or SATA drive

The server can support 8 SAS or SATA hard drives in a SFF configuration, or 10 drives in an SFF configuration with the optional hard drive cage. In an LFF configuration, the server can support 4 SAS or SATA hard drives.

To install the component:

1. Remove the drive blank.
2. Prepare the drive.

3. Install the drive.

Removing a hot-plug SAS or SATA drive

⚠️ **CAUTION:** For proper cooling, do not operate the server without the access panel, baffles, expansion slot covers, or blanks installed. If the server supports hot-plug components, minimize the amount of time the access panel is open.

1. Determine the status of the drive from the hot-plug SAS drive LED combinations.
2. Back up all server data on the drive.
3. Remove the drive.

Installing the NVMe drives

NVMe drives are supported on this server when the 10SFF (6 NVMe + 4 SAS/SATA) Express Bay Enablement Option and/or the 2SFF Express Bay Drive Cage is installed. For more information on which bays support NVMe drives, see "Device numbers (on page 17)."

To install the drives:
**CAUTION:** To prevent improper cooling and thermal damage, do not operate the server or the enclosure unless all drive and device bays are populated with either a component or a blank.

1. Remove the drive blank, if installed.

2. Press the Do Not Remove button to open the release handle.

3. Install the drives.

4. Install an SFF drive blank in any unused drive bays.

**CAUTION:** Do not remove an NVMe SSD from the drive bay while the Do Not Remove button LED is flashing. The Do Not Remove button LED flashes to indicate the device is still in use. Removal of the NVMe SSD before the device has completed and ceased signal/traffic flow can cause loss of data.
To remove the component:

1. Press the Power button.
   The Do Not Remove button LED illuminates and flashes. Do not press the button while the LED is illuminated.
2. When the Do Not Remove button LED is no longer flashing or illuminated, press the Do Not Remove button to open the release lever.

3. Remove the drive.

---

### 2SFF SAS/SATA drive cage assembly option

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the universal media bay blank.

6. Install the drive cage assembly, and then tighten the three screws.
7. Connect the data cables to the SATA storage connector, the SATA optical/storage drive connector, and the backplane presence detect connector.

8. Connect the power cable to the left power connector on the backplane.

⚠️ **CAUTION:** To prevent improper cooling and thermal damage, do not operate the server or the enclosure unless all drive and device bays are populated with either a component or a blank.
9. Install drives or blanks in the empty drive bays.

2SFF Express Bay drive backplane

⚠️ **CAUTION:** To prevent damage to electrical components, take the appropriate anti-static precautions before beginning any system installation. Improper grounding can cause electrostatic discharge.

To install the component:

1. Back up all server data.
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove all drives ("Removing a hot-plug SAS or SATA drive" on page 50) and drive blanks ("Removing the hard drive blank" on page 49).
6. Disconnect and remove all cables connected to the drive backplane.
7. Remove the universal media bay blank.

8. Install the drive cage assembly, then tighten the three screws.

9. Remove the primary PCI riser cage ("Remove the PCI riser cage" on page 23).

10. Install the Express Bay bridge card in slot 1 of the primary PCI riser cage.
11. Install the primary PCI riser cage ("Install the PCI riser cage" on page 24).
12. Connect the data cables from the Express Bay drive cage to port 3 on the Express Bay bridge card.

13. Connect the power cable to the left power connector on the backplane.

⚠️ **CAUTION:** To prevent improper cooling and thermal damage, do not operate the server or the enclosure unless all drive and device bays are populated with either a component or a blank.

15. Install the NVMe drives ("Installing the NVMe drives" on page 50).
16. Install the access panel (on page 22).
17. Install the server into the rack.
18. Connect each power cord to the server.
19. Connect each power cord to the power source.
20. Press the Power On/Standby button.
   The server exits standby mode and applies full power to the system. The system power LED
   changes from amber to green.

4LFF Universal Media Bay option

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the
   internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before
   beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the bay blanks.
   - 4 LFF optical drive blank
6. Install the universal media bay option.
   - 4 LFF optical drive.
     After installing the 4 LFF optical drive, connect the ODD cable to the rear of the drive.
7. Route the cables along the edge of the system board, and then connect the cables to the system board.
   - 4 LFF VGA/USB connections
     Connect the VGA/USB cable to the Front VGA/USB connector toward the rear of the system board.
   - 4 LFF optical drive connection
Connect the SATA optical cable to the SATA optical/storage drive connector.

8. Install the access panel (on page 22).
9. Slide the server into the rack.
10. Connect all power cords to the server, and then power up the server.

8SFF Universal Media Bay option

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the universal media bay blank.

6. Install the universal media bay option.
   - 8SFF DVD-RW/VGA/USB
7. Route the cables along the edge of the system board, and then connect the cables to the system board.
   - 8SFF DVD-RW/VGA/USB connections
     Connect the VGA/USB cable to the Front VGA/USB connector toward the rear of the system board.
     Connect the SATA optical cable to the SATA optical/storage drive connector.
Connect the VGA/USB cable to the Front VGA/USB connector toward the rear of the system board.

8. Install the access panel (on page 22).
9. Slide the server into the rack.
10. Connect all power cords to the server, and then power up the server.

**10SFF (6 NVMe + 4 SAS/SATA) Express Bay drive backplane**

The 10SFF (6 NVMe + 4 SAS/SATA) Express Bay Enablement Kit includes the following components:

- 8SFF Express Bay Drive Cage backplane
- 2SFF Express Bay Drive Cage backplane
- 2SFF Express Bay Drive Cage
- Express Bay Bridge Card

This option provides support for up to six SFF NVMe SSDs and four SFF SAS drives, SATA drives, or SSDs. The high-performance fans and a controller, such as the HPE Smart Array P440ar Controller, must be installed when installing this option.

For more information about NVMe SSDs, see the Hewlett Packard Enterprise website ([http://www.hpe.com/support/NVMedrive_en](http://www.hpe.com/support/NVMedrive_en)). For more information on supported drives and population rules, see the server user guide on the Hewlett Packard Enterprise website. ([http://www.hpe.com/support/DL360Gen9/docs](http://www.hpe.com/support/DL360Gen9/docs))

To install the component:
1. Back up all server data.
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Do one of the following:
   a. Extend the server from the rack (on page 21).
   b. Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove all drives ("Removing a hot-plug SAS or SATA drive" on page 50) and drive blanks ("Removing the hard drive blank" on page 49).
6. Disconnect and remove all cables connected to the drive backplane.
7. Remove the 8SFF SAS/SATA drive backplane ("Removing the 8 SFF drive backplane" on page 25).
8. Install the 8SFF Express Bay backplane.
9. Install the 2SFF Express Bay Enablement Option ("2SFF Express Bay drive backplane" on page 55).
10. Remove the primary PCI riser cage ("Remove the PCI riser cage" on page 23).
11. Install the Express Bay Bridge card in slot 1 of the primary PCI riser cage.
12. Install the primary PCI riser cage ("Install the PCI riser cage" on page 24).
13. Cable the 10SFF (6 NVMe + 4 SAS/SATA) Express Bay Enablement Options ("10SFF (6 NVMe + 4 SAS/SATA) Express Bay Enablement Option cabling" on page 110).
15. Install the NVMe drives ("Installing the NVMe drives" on page 50). For more information on which bays support NVMe drives, see "Device numbers (on page 17)."
16. Install the SAS or SATA drives ("Installing a hot-plug SAS or SATA drive" on page 49). For more information on which bays support SAS and SATA drives, see "Device numbers (on page 17)."
17. Install the access panel (on page 22).
18. Install the server into the rack.
19. Connect each power cord to the server.
20. Connect each power cord to the power source.
21. Press the Power On/Standby button.
   The server exits standby mode and applies full power to the system. The system power LED
   changes from amber to green.

**GPU riser and cable option**

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the
   internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before
   beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the primary PCI riser cage ("Remove the PCI riser cage" on page 23).
6. Install the GPU in the x16 slot in the primary PCI riser cage position. The PCI riser cage assembly
   with the full-length, full-height PCIe3 x16 riser slot is required for GPU installation. For more
   information, see "Full height PCIe x16 riser cage assembly option (on page 68)."

Before installing a high-power GPU in the server, be sure that the power supplies support the
installation of the option. Because of the high power requirements for the GPU, a 800-W or higher
power supply might be required. For more information, see the Hewlett Packard Enterprise
Configurator website (http://www.hpe.com/info/SimpleConfigurator ).
7. Install the GPU support bracket.

8. Install the riser cage.
9. Connect the GPU riser cable to the GPU and the primary riser cage PCA.

Secondary riser options
The server supports low-profile or full-height risers in the secondary riser cage position.

Full height PCIe x16 riser cage assembly option
This option includes GPU support for a secondary riser.

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the primary PCI riser cage ("Remove the PCI riser cage" on page 23).
6. If installed, remove the low profile riser board from the secondary riser board slot. Remove the riser cage bracket from the primary PCIe riser cage.

7. Lift and remove the riser cage latch.
8. Install the full height PCIe x16 riser cage latch.

9. Align the PCIe x16 riser cage with the corresponding connector on the system board, and then press down on the riser cage.

An HPE DL360 Gen9 Smart Array P440ar Controller for 2 GPU configurations (726740-B21) is required when configuring the server with dual GPU cards. If a GPU is installed in the full height PCIe riser cage option, connect the GPU cable to the riser cage connector and the installed GPU.

⚠️ **CAUTION:** To prevent improper cooling and thermal damage, do not operate the server unless all PCI slots have either an expansion slot cover or an expansion board installed.
The HPE Smart Array P440ar Controller with cut heatsink (726740-B21) allows for clearance when a GPU is installed in the secondary full-height riser cage.

The HPE Smart Array P440ar Controller is required when 2 GPUs are installed in the server.

**Low-profile PCIe slot riser cage option**

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.
1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Install the low-profile riser cage.

HPE Smart Storage Battery

To install the component:
1. Power down the server (on page 21).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Install the Smart Storage battery.

6. Connect the cable.

7. Install the access panel (on page 22).

8. Slide the server into the rack.

9. Connect each power cord to the server.

10. Connect each power cord to the power source.

11. Power up the server ("Powering up the server" on page 21).

HPE Smart Array P440ar Controller option

⚠️ WARNING: To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ CAUTION: To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.
1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Install the HPE Smart Array P440ar controller.
6. Connect the SAS/SATA cables to the backplane and Smart Array controller. Install the SAS/SATA cables according to their labels as Port 1 or Port 2. These labels are on the cables and their connections.
   - 8SFF
HPE Smart Array P440 Controller option

⚠️ WARNING: To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ CAUTION: To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the primary PCI riser cage ("Remove the PCI riser cage" on page 23).
6. Remove the slot two expansion board blank.
The controller board can be installed in slot 1 or slot 2.

7. Install the controller board into slot 2 of the riser cage.

8. Install the riser cage in the server ("Install the PCI riser cage" on page 24).

9. Connect the cables from port one and two on the backplane to port one on the P440 controller board. If the H240 controller board is installed, the SAS cables will use both ports.
   - 8SFF
HPE Smart Array P840ar Controller option

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Install the HPE Smart Array P840ar controller.

6. Connect both the Mini-SAS connectors from the 8SFF backplane to controller port 1.

7. If the optional 2SFF backplane is installed, connect the Mini-SAS cable to controller port 2.

HPE Smart Array P840 Controller board option

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
- Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the primary PCI riser cage ("Remove the PCI riser cage" on page 23).
6. Install the P840 controller board.

7. Install the riser board assembly.
8. Connect the Mini-SAS cables from the standard backplane to port one on the optional P840 controller board.

9. If the 2SFF SAS/SATA backplane is installed, connect the Mini-SAS cable from the optional backplane to port 2 on the P840 controller board.
Systems Insight Display module

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Disconnect the Power/UID/USB cable from the front power button/USB 3.0 connector on the system board.
6. Remove the Power/UID/USB assembly.
CAUTION: When routing cables, always be sure that the cables are not in a position where they can be pinched or crimped.
To install the SID module:

1. Guide the SID cable through the front of the server.

2. Install the SID module into the front panel and secure the module to the chassis with the screws from the kit.
   - 8SFF
3. Connect the SID cables to the front power button/USB 3.0 connector on the system board.

FlexibleLOM option

⚠️ WARNING: To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ CAUTION: To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the FlexibleLOM PCIe blank.

6. Install the component:
   a. Firmly seat the FlexibleLOM in the slot.
   b. Tighten the thumbscrew.

7. Install the access panel (on page 22).
8. Slide the server into the rack.
9. Connect the LAN segment cables.
10. Connect each power cord to the server.
11. Connect each power cord to the power source.
12. Power up the server ("Powering up the server" on page 21).

Serial cable option

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the serial cable blank.
6. Connect the serial cable option. Then, remove the backing from the double-sided tape and press down where indicated.

Expansion board options
The server supports PCI Express expansion boards. The server ships with PCIe riser boards and expansion slots. PCIe expansion boards are supported with optional riser boards.

Removing the expansion slot blanks

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Disconnect any external cables that are connected to the expansion board.
6. Disconnect any internal cables that are connected to the expansion board.
7. Remove the primary PCI riser cage ("Remove the PCI riser cage" on page 23).
8. Remove the expansion slot blank:
- Primary PCI riser cage
- Secondary PCI riser cage
Installing an expansion board

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause ESD.

1. Back up all server data.
2. Power down the server (on page 21).
3. Do one of the following:
   - Extend the server from the rack (on page 21).
   - Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the primary PCI riser cage ("Remove the PCI riser cage" on page 23).
6. Remove the expansion slot blank ("Removing the expansion slot blanks" on page 87).
7. Install the expansion board:
   - Primary riser cage
   - Secondary riser cage

8. Connect any required internal or external cables to the expansion board. See the documentation that ships with the expansion board.

9. Install the PCI riser cage (on page 24).
10. Install the access panel (on page 22).
11. Install the server into the rack.
12. Connect each power cord to the server.
13. Connect each power cord to the power source.
14. Power up the server ("Powering up the server" on page 21).

Location discovery services ear option

1. Remove all power:
a. Disconnect each power cord from the power source.
b. Disconnect each power cord from the server.
2. Remove the access panel (on page 22).
3. Remove the hot-plug fan or fan blank from fan bay 1.
4. Remove the location discovery cable protection panel from the left side of the server.
5. Remove the standard ear.

6. Install the location discovery services ear option and route the location discovery services cable through side channel.
7. Install the discovery cable protection panel.

8. Connect the location discovery services cable to the location discovery services connector on the system board.
9. Install the hot-plug fan or fan blank into fan bay 1.

M.2 SSD Enablement Board option

The M.2 enablement board is supported in slot 1 or 2 with the full-height bracket on the primary riser cage and in slot 3 with the low-profile bracket on the secondary riser cage.

Installing an SSD module on the M.2 SSD Enablement Board

1. Power down the server (on page 21).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Extend the server from the rack (on page 21).
4. Remove the access panel (on page 22).
5. Remove the PCIe riser cage ("Remove the PCI riser cage" on page 23).
6. Remove the expansion slot blank ("Removing the expansion slot blanks" on page 87).

IMPORTANT: For management and monitoring of the SSD modules, use the HPE Smart Storage Administrator (http://www.hpe.com/servers/ssa).
7. Install the SSD module on the M.2 SSD enablement board.

8. Install the M.2 SSD enablement board in any slot in the primary or secondary PCI riser cage ("Installing an expansion board" on page 89).

9. Install the PCI riser cage (on page 24).
10. Install the access panel (on page 22).
11. Install the server into the rack.
12. Connect each power cord to the server.
13. Connect each power cord to the power source.
14. Power up the server ("Powering up the server" on page 21).

Installing an M.2 SSD Enablement Board

The M.2 SSD enablement board is supported in either slot 1 or 2 of the Primary riser cage and slot 3 on the secondary PCI riser cage.

To install the component:
1. Power down the server (on page 21).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Extend the server from the rack (on page 21).
4. Remove the access panel (on page 22).
5. Remove the PCI riser cage (on page 23).
6. If the board is installed in slot 2 or 3 (the low-profile riser), then do the following:
a. Remove the full-height bracket from the M.2 SSD enablement board.

b. Install the low-profile bracket on the M.2 SSD enablement board.

7. Remove the expansion slot cover.
8. Install the M.2 SSD enablement board into either slot 1 or 2 of the primary PCI riser or in slot 3 of the secondary PCI riser. Be sure that the correct bracket is installed as directed earlier in this process.

9. Connect and route the SATA cables from the M.2 SSD enablement board to the system board.
   - M.2 SSD enablement board installed in slot 1 of the primary PCI riser
10. Install the PCI riser cage (on page 24).
11. Install the access panel (on page 22).
12. Install the server into the rack.
13. Connect each power cord to the server.
14. Connect each power cord to the power source.
15. Power up the server (“Powering up the server” on page 21).

Dual 8Gb microSD Enterprise Midline USB device

This server supports the installation of the Dual 8Gb microSD Enterprise Midline USB device on the server internal USB connector.

This USB storage device contains a dual-SD card module that supports up to two SD, SDHC, or SDXC storage cards providing data redundancy through a mirrored RAID-1 configuration. This USB storage device connects to an internal USB connector and is configured upon boot.

To locate the internal USB connector, see “System board components (on page 14).” For more information, see the Dual 8Gb microSD EM USB storage device documentation on the Hewlett Packard Enterprise website (http://www.hpe.com/support/8GBDualMicrosd_ug_en).

750 W Flex Slot Hot Plug Battery Backup Module

The FSBBU is a self-contained unit with internal lithium-ion batteries that provide DC 12V backup power for servers when either the main bus utility power fails or the power supply is out of regulation.

You do not have to power down the server before removing or installing an FSBBU.

Flex slot battery backup module configuration load support

The FSBBU module can be daisy chained to only one other FSBBU module. When AC power is lost to one server, then the loads of both servers will determine if the FSBBU will support the combined load.
Installing the FSBBU

⚠️ CAUTION: To prevent improper cooling and thermal damage, do not operate the chassis unless all bays are populated with a component or a blank.

To install the component:

1. Access the product rear panel.
2. Remove the blank.

⚠️ WARNING: To reduce the risk of personal injury from hot surfaces, allow the FSBBU or power supply blank to cool before touching it.

3. Press the battery check button located on the rear of the FSBBU module to check the battery condition before installing the unit into the power supply bay. To locate the battery check button and for more information on the FSBBU module LED status, see "Flex slot battery backup module LEDs and buttons (on page 102)."
4. Install the FSBBU module into the power supply bay until it clicks into place.

5. Connect multiple FSBBU units using a daisy chain configuration. A jumper cable (part number K9B28A) is required for a daisy chain configuration.

6. Charge the FSBBU module until the LED is solid green.

For more information about product features, specifications, options, configurations, and compatibility, see the product QuickSpecs on the Hewlett Packard Enterprise website (http://www.hpe.com/info/qsl).

**Flex slot battery backup module LEDs and buttons**

**Trusted Platform Module option**

For more information about product features, specifications, options, configurations, and compatibility, see the product QuickSpecs on the Hewlett Packard Enterprise website [http://www.hpe.com/info/qs](http://www.hpe.com/info/qs).

Use these instructions to install and enable a TPM on a supported server. This procedure includes three sections:

1. Installing the Trusted Platform Module board (on page 104).
2. Retaining the recovery key/password (on page 105).

Enabling the TPM requires accessing BIOS/Platform Configuration (RBSU) in the UEFI System Utilities ("HPE UEFI System Utilities" on page 122).

TPM installation requires the use of drive encryption technology, such as the Microsoft Windows BitLocker Drive Encryption feature. For more information on BitLocker, see the Microsoft website [http://www.microsoft.com](http://www.microsoft.com).

⚠️ **CAUTION:** Always observe the guidelines in this document. Failure to follow these guidelines can cause hardware damage or halt data access.
When installing or replacing a TPM, observe the following guidelines:

- Do not remove an installed TPM. Once installed, the TPM becomes a permanent part of the system board.
- When installing or replacing hardware, Hewlett Packard Enterprise service providers cannot enable the TPM or the encryption technology. For security reasons, only the customer can enable these features.
- When returning a system board for service replacement, do not remove the TPM from the system board. When requested, Hewlett Packard Enterprise Service provides a TPM with the spare system board.
- Any attempt to remove an installed TPM from the system board breaks or disfigures the TPM security rivet. Upon locating a broken or disfigured rivet on an installed TPM, administrators should consider the system compromised and take appropriate measures to ensure the integrity of the system data.
- When using BitLocker, always retain the recovery key/password. The recovery key/password is required to enter Recovery Mode after BitLocker detects a possible compromise of system integrity.
- Hewlett Packard Enterprise is not liable for blocked data access caused by improper TPM use. For operating instructions, see the encryption technology feature documentation provided by the operating system.

Installing the Trusted Platform Module board

⚠️ **WARNING:** To reduce the risk of personal injury, electric shock, or damage to the equipment, remove the power cord to remove power from the server. The front panel Power On/Standby button does not completely shut off system power. Portions of the power supply and some internal circuitry remain active until AC power is removed.

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

To install the component:
1. Power down the server (on page 21).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. Remove the PCI riser cage (on page 23).

⚠️ **CAUTION:** Any attempt to remove an installed TPM from the system board breaks or disfigures the TPM security rivet. Upon locating a broken or disfigured rivet on an installed TPM, administrators should consider the system compromised and take appropriate measures to ensure the integrity of the system data.
6. Install the TPM board. Press down on the connector to seat the board ("System board components" on page 14).

7. Install the TPM security rivet by pressing the rivet firmly into the system board.

8. Install the PCI riser cage (on page 24).
9. Install the access panel (on page 22).
10. Install the server into the rack.
11. Power up the server ("Powering up the server" on page 21).

Retaining the recovery key/password

The recovery key/password is generated during BitLocker setup, and can be saved and printed after BitLocker is enabled. When using BitLocker, always retain the recovery key/password. The recovery key/password is required to enter Recovery Mode after BitLocker detects a possible compromise of system integrity.

To help ensure maximum security, observe the following guidelines when retaining the recovery key/password:

- Always store the recovery key/password in multiple locations.
- Always store copies of the recovery key/password away from the server.
• Do not save the recovery key/password on the encrypted hard drive.

Enabling the Trusted Platform Module

1. During the server startup sequence, press the F9 key to access System Utilities.
2. From the System Utilities screen, select System Configuration > BIOS/Platform Configuration (RBSU) > Server Security.
3. Select Trusted Platform Module Options and press the Enter key.
4. Select Enabled to enable the TPM and BIOS secure startup. The TPM is fully functional in this mode.
5. Press the F10 key to save your selection.
6. When prompted to save the change in System Utilities, press the Y key.
7. Press the ESC key to exit System Utilities. Then, press the Enter key when prompted to reboot the server.

The server then reboots a second time without user input. During this reboot, the TPM setting becomes effective.

You can now enable TPM functionality in the OS, such as Microsoft Windows BitLocker or measured boot.

⚠️ CAUTION: When a TPM is installed and enabled on the server, data access is locked if you fail to follow the proper procedures for updating the system or option firmware, replacing the system board, replacing a hard drive, or modifying OS application TPM settings.

For more information on firmware updates and hardware procedures, see the HP Trusted Platform Module Best Practices White Paper on the Hewlett Packard Enterprise Support Center website (http://www.hpe.com/support/hpesc).

For more information on adjusting TPM usage in BitLocker, see the Microsoft website (http://technet.microsoft.com/en-us/library/cc732774.aspx).
Cabling

Cabling overview

This section provides guidelines that help you make informed decisions about cabling the server and hardware options to optimize performance.

⚠️ **CAUTION:** When routing cables, always be sure that the cables are not in a position where they can be pinched or crimped.

2SFF embedded SATA backplane cabling

1. Connect the data cables to the SATA storage connector, the SATA optical/storage drive connector, and the backplane presence detect connector.
2. Connect the power cable to the left power connector on the backplane.

**NOTE:** Cabling from the 2SFF SAS/SATA backplane will vary if a PCIe storage controller is installed.

### 4LFF Universal Media Bay cabling

Route the cables along the edge of the system board, and then connect the cables to the system board:

- **4LFF VGA/USB connections**
  
  Connect the VGA/USB cable to the front VGA/USB connector toward the rear of the system board.

- **4LFF optical drive connection**
Connect the SATA optical cable to the SATA optical/storage drive connector.

8SFF Universal Media Bay cabling

Route the cables along the edge of the system board, and then connect the cables to the system board:

- **8SFF DVD-RW/VGA/USB connections**
  - Connect the VGA/USB cable to the front VGA/USB connector toward the rear of the system board.
  - Connect the SATA optical cable to the SATA optical/storage drive connector.

- **8SFF VGA/USB connections**
Connect the VGA/USB cable to the front VGA/USB connector toward the rear of the system board.

10SFF (6 NVMe + 4 SAS/SATA) Express Bay Enablement Option cabling

The Smart Array P440ar Controller is shown in the cabling diagram, but other controllers may be supported. For a list of supported controllers, see the product QuickSpecs on the Hewlett Packard Enterprise website (http://www.hpe.com/info/qs).

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Connect the power cable from the 10SFF Express Bay backplane to the system board.</td>
</tr>
<tr>
<td>Item</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>2</td>
<td>Connect the power cable from the 10SFF Express Bay backplane to the 2SFF Express Bay backplane.*</td>
</tr>
<tr>
<td>3</td>
<td>Connect the mini-SAS cable from the 10SFF Express Bay backplane to Port 1 on the controller (HPE Smart Array P440ar Controller shown).</td>
</tr>
<tr>
<td>4</td>
<td>Connect the 2SFF Express bay data cable from 2SFF Express Bay backplane to Port 3 on the HPE Express Bay Bridge Card.*</td>
</tr>
<tr>
<td>5–6</td>
<td>Connect the 10SFF Express bay data cable from 10SFF Express Bay backplane to Ports 1 and 2 on the HPE Express Bay Bridge Card.</td>
</tr>
</tbody>
</table>

*If the 2SFF Express Bay Enablement option is not installed, then this cable is not required.

### HPE Smart Array P440ar controller cabling

Connect the SAS/SATA cables to the backplane and Smart Array controller. Install the SAS/SATA cables according to their labels as Port 1 or Port 2. These labels are on the cables and their connections.

- **8SFF**

![Diagram of HPE Smart Array P440ar controller cabling](image-url)
• **4LFF**

HPE Smart Array P440 Controller cabling

Connect the cables from port one and two on the backplane to port one on the P440 controller board. If the H240 controller board is installed, the SAS cables will use both ports.

• **8SFF**
• 4LFF

HPE Smart Array P840ar controller cabling

1. Connect both the Mini-SAS connectors from the 8SFF backplane to controller port 1.
2. If the optional 2SFF backplane is installed, connect the Mini-SAS cable to controller port 2.
HPE Smart Array P840 Controller cabling

1. Connect the Mini-SAS cables from the standard backplane to port one on the optional P840 controller board.

2. If the 2SFF SAS/SATA backplane is installed, connect the Mini-SAS cable from the optional backplane to port 2 on the P840 controller board.
Embedded SATA cabling

⚠️ WARNING: Eliminate the risk of electric shock by removing all AC power from the system before installing or replacing any non-hot-plug hardware option. Disconnect all power cords to completely remove power from the server.

Connect the SATA cables from the backplane to the Mini-SAS/SATA connectors on the system board according to their labels as Port 1 or Port 2. These labels are on the cables and their connections.

- **8SFF**

- **4LFF**
  
  Connect the SATA cable from port one on the backplane to port one on the system board as indicated on the connectors.
M.2 SSD Enablement Board option cabling

The M.2 SSD enablement board option is supported in both the primary and the secondary PCI riser cage.

Cable the option according to the location in the server:

- **Primary PCI riser cage**

- **Secondary PCI riser cage**
Software and configuration utilities

Server mode

The software and configuration utilities presented in this section operate in online mode, offline mode, or in both modes.

Product QuickSpecs

For more information about product features, specifications, options, configurations, and compatibility, see the product QuickSpecs on the Hewlett Packard Enterprise website (http://www.hpe.com/info/qs).

HPE iLO

iLO is a remote server management processor embedded on the system boards of HPE ProLiant and Synergy servers. iLO enables the monitoring and controlling of servers from remote locations. HPE iLO management is a powerful tool that provides multiple ways to configure, update, monitor, and repair servers remotely. iLO (Standard) comes preconfigured on HPE servers without an additional cost or license.

Features that enhance server administrator productivity are licensed. For more information, see the iLO 4 documentation on the Hewlett Packard Enterprise website (http://www.hpe.com/info/ilo-docs).

Active Health System

The HPE Active Health System provides the following features:

- Combined diagnostics tools/scanners
• Always on, continuous monitoring for increased stability and shorter downtimes
• Rich configuration history
• Health and service alerts
• Easy export and upload to Service and Support

The Active Health System monitors and records changes in the server hardware and system configuration. The Active Health System assists in diagnosing problems and delivering rapid resolution if server failures occur.

The Active Health System collects the following types of data:
• Server model
• Serial number
• Processor model and speed
• Storage capacity and speed
• Memory capacity and speed
• Firmware/BIOS

Active Health System does not collect information about Active Health System users’ operations, finances, customers, employees, partners, or data center, such as IP addresses, host names, user names, and passwords. Active Health System does not parse or change operating system data from third-party error event log activities, such as content created or passed through by the operating system.

The data that is collected is managed according to the Hewlett Packard Enterprise Data Privacy policy. For more information see the Hewlett Packard Enterprise website (http://www.hpe.com/info/privacy).

The Active Health System, in conjunction with the system monitoring provided by Agentless Management or SNMP Pass-thru, provides continuous monitoring of hardware and configuration changes, system status, and service alerts for various server components.

The Agentless Management Service is available in the SPP, which can be downloaded from the Hewlett Packard Enterprise website (http://www.hpe.com/servers/spp/download). The Active Health System log can be downloaded manually from iLO 4 or HPE Intelligent Provisioning and sent to Hewlett Packard Enterprise.

For more information, see the following documents:
• iLO User Guide on the Hewlett Packard Enterprise website (http://www.hpe.com/info/ilo/docs)
• Intelligent Provisioning User Guide on the Hewlett Packard Enterprise website (http://www.hpe.com/info/intelligentprovisioning/docs)

iLO RESTful API support

HPE iLO 4 firmware version 2.00 and later includes the iLO RESTful API. The iLO RESTful API is a management interface that server management tools can use to perform configuration, inventory, and monitoring of the ProLiant server via iLO. The iLO RESTful API uses basic HTTPS operations (GET, PUT, POST, DELETE, and PATCH) to submit or return JSON-formatted data with iLO web server.

HPE iLO 4 2.30 and later is Redfish 1.0-conformant while remaining backward compatible with the existing iLO RESTful API.

HPE iLO 4 supports the iLO RESTful API with ProLiant Gen8 and later servers. For more information about the iLO RESTful API, see the Hewlett Packard Enterprise website (http://www.hpe.com/info/restfulinterface/docs).
Integrated Management Log

The IML records hundreds of events and stores them in an easy-to-view form. The IML timestamps each event with 1-minute granularity.

You can view recorded events in the IML in several ways, including the following:

- From within HPE SIM
- From within UEFI System Utilities ("HPE UEFI System Utilities" on page 122)
- From within the Embedded UEFI shell (on page 124)
- From within operating system-specific IML viewers:
  - For Windows: IML Viewer
  - For Linux: IML Viewer Application
- From within the iLO web interface
- From within Insight Diagnostics ("HPE Insight Diagnostics" on page 120)

HPE Insight Remote Support

Hewlett Packard Enterprise strongly recommends that you register your device for remote support to enable enhanced delivery of your Hewlett Packard Enterprise warranty, HPE support services, or Hewlett Packard Enterprise contractual support agreement. Insight Remote Support supplements your monitoring continuously to ensure maximum system availability by providing intelligent event diagnosis, and automatic, secure submission of hardware event notifications to Hewlett Packard Enterprise, which will initiate a fast and accurate resolution, based on your product’s service level. Notifications can be sent to your authorized Hewlett Packard Enterprise Channel Partner for onsite service, if configured and available in your country.

For more information, see Insight Remote Support and Insight Online Setup Guide for ProLiant Servers and BladeSystem c-Class Enclosures on the Hewlett Packard Enterprise website (http://www.hpe.com/info/insightremotesupport/docs). Insight Remote Support is available as part of Hewlett Packard Enterprise Warranty, HPE support services, or Hewlett Packard Enterprise contractual support agreement.

HPE Insight Remote Support central connect

When you use the embedded Remote Support functionality with ProLiant Gen8 and later server models and BladeSystem c-Class enclosures, you can register a server or enclosure to communicate to Hewlett Packard Enterprise through an Insight Remote Support centralized Hosting Device in your local environment. All configuration and service event information is routed through the Hosting Device. This information can be viewed by using the local Insight Remote Support user interface or the web-based view in Insight Online.

HPE Insight Online direct connect

When you use the embedded Remote Support functionality with ProLiant Gen8 and later server models and BladeSystem c-Class enclosures, you can register a server or enclosure to communicate directly to Insight Online without the need to set up an Insight Remote Support centralized Hosting Device in your local environment. Insight Online will be your primary interface for remote support information.

For more information, see the product documentation on the Hewlett Packard Enterprise website (http://www.hpe.com/info/insightremotesupport/docs).
Insight Online

HPE Insight Online is a capability of the Support Center portal. Combined with Insight Remote Support central connect or Insight Online direct connect, it automatically aggregates device health, asset, and support information with contract and warranty information, and then secures it in a single, personalized dashboard that is viewable from anywhere at any time. The dashboard organizes your IT and service data to help you understand and respond to that information more quickly. With specific authorization from you, an authorized Channel Partner can also view your IT environment remotely using Insight Online.

For more information about using Insight Online, see Insight Online User’s Guide on the Hewlett Packard Enterprise website (http://www.hpe.com/info/enterprise/docs).

Intelligent Provisioning

Intelligent Provisioning is a single-server deployment tool embedded in ProLiant Gen8 and later servers that simplifies ProLiant server setup, providing a reliable and consistent way to deploy ProLiant server configurations:

- Intelligent Provisioning assists with the OS installation process by preparing the system for installing "off-the-shelf" and Hewlett Packard Enterprise branded versions of operating system software and integrating optimized ProLiant server support software.
- Intelligent Provisioning provides maintenance-related tasks using the Perform Maintenance window.
- Intelligent Provisioning provides installation help for Microsoft Windows, Red Hat and SUSE Linux, and VMware operating systems. For specific OS support, see the Intelligent Provisioning Release Notes on the Hewlett Packard Enterprise website (http://www.hpe.com/info/intelligentprovisioning/docs).

For more information about Intelligent Provisioning software, see the Hewlett Packard Enterprise website (http://www.hpe.com/servers/intelligentprovisioning). For Intelligent Provisioning recovery media downloads, see the Resources tab on the Hewlett Packard Enterprise website (http://www.hpe.com/servers/intelligentprovisioning). For consolidated drive and firmware update packages, see the Smart Update: Server Firmware and Driver Updates page on the Hewlett Packard Enterprise website (http://www.hpe.com/info/SmartUpdate).

HPE Insight Diagnostics

The Insight Diagnostics is a proactive server management tool, available in both offline and online versions, that provides diagnostics and troubleshooting capabilities to assist IT administrators who verify server installations, troubleshoot problems, and perform repair validation.

The Insight Diagnostics Offline Edition performs various in-depth system and component testing while the OS is not running. To run this utility, boot the server using Intelligent Provisioning (on page 120).

The Insight Diagnostics Online Edition is a web-based application that captures system configuration and other related data needed for effective server management. Available in Microsoft Windows and Linux versions, the utility helps to ensure proper system operation.

For more information or to download the utility, see the Hewlett Packard Enterprise website (http://www.hpe.com/info/InsightDiagnostics). The Insight Diagnostics Online Edition is also available in the SPP (“Service Pack for ProLiant” on page 122).

HPE Insight Diagnostics survey functionality

HPE Insight Diagnostics (on page 120) provides survey functionality that gathers critical hardware and software information on ProLiant servers.

This functionality supports operating systems that are supported by the server. For operating systems supported by the server, see the Hewlett Packard Enterprise website (http://www.hpe.com/info/supportos).
If a significant change occurs between data-gathering intervals, the survey function marks the previous information and overwrites the survey data files to reflect the latest changes in the configuration.

Survey functionality is installed with every Intelligent Provisioning-assisted Insight Diagnostics installation, or it can be installed through the SPP ("Service Pack for ProLiant" on page 122).

Erase Utility

⚠️ **CAUTION:** Perform a backup before running the Erase Utility. The utility sets the system to its original factory state, deletes the current hardware configuration information, including array setup and disk partitioning, and erases all connected hard drives completely. Before using this utility, see the instructions in the *Intelligent Provisioning User Guide*.

Use the Erase Utility to erase drives and Active Health System logs, and to reset UEFI System Utilities settings. Run the Erase Utility if you must erase the system for the following reasons:

- You want to install a new operating system on a server with an existing operating system.
- You encounter an error when completing the steps of a factory-installed operating system installation.

To access the Erase Utility, click the Perform Maintenance icon from the Intelligent Provisioning home screen, and then select **Erase**.

For more information about the Erase Utility, see the *Intelligent Provisioning User Guide* on the Hewlett Packard Enterprise website ([http://www.hpe.com/info/intelligentprovisioning/docs](http://www.hpe.com/info/intelligentprovisioning/docs)).

Scripting Toolkit for Windows and Linux

The STK for Windows and Linux is a server deployment product that delivers an unattended automated installation for high-volume server deployments. The STK is designed to support ProLiant servers. The toolkit includes a modular set of utilities and important documentation that describes how to apply these tools to build an automated server deployment process.

The STK provides a flexible way to create standard server configuration scripts. These scripts are used to automate many of the manual steps in the server configuration process. This automated server configuration process cuts time from each deployment, making it possible to scale rapid, high-volume server deployments.

For more information or to download the STK, see the Hewlett Packard Enterprise website ([http://www.hpe.com/servers/proliant/stk](http://www.hpe.com/servers/proliant/stk)).

Smart Update Manager

Smart Update Manager is a product used to install and update firmware, drivers, and systems software on ProLiant servers. The SUM provides a GUI and a command-line scriptable interface for deployment of systems software for single or one-to-many ProLiant servers and network-based targets, such as iLOs, OAs, and VC Ethernet and Fibre Channel modules.

For more information about SUM, see the product page on the Hewlett Packard Enterprise website ([http://www.hpe.com/info/hpsum](http://www.hpe.com/info/hpsum)).

To download SUM, see the Hewlett Packard Enterprise website ([http://www.hpe.com/info/hpsum/download](http://www.hpe.com/info/hpsum/download)).

To access the user guide, see the SUM Information Library ([http://www.hpe.com/info/hpsum/documentation](http://www.hpe.com/info/hpsum/documentation)).
Service Pack for ProLiant

The SPP is a comprehensive systems software (drivers and firmware) solution delivered as a single package with major server releases. This solution uses HP SUM as the deployment tool and is tested on all supported ProLiant servers including ProLiant Gen8 and later servers.

SPP can be used in an online mode on a Windows or Linux hosted operating system, or in an offline mode where the server is booted to an operating system included on the ISO file so that the server can be updated automatically with no user interaction or updated in interactive mode.

For more information or to download SPP, see one of the following pages on the Hewlett Packard Enterprise website:

- Service Pack for ProLiant download page (http://www.hpe.com/servers/spp/download)
- Smart Update: Server Firmware and Driver Updates page (http://www.hpe.com/info/SmartUpdate)

HPE UEFI System Utilities

The UEFI System Utilities is embedded in the system ROM. The UEFI System Utilities enable you to perform a wide range of configuration activities, including:

- Configuring system devices and installed options
- Enabling and disabling system features
- Displaying system information
- Selecting the primary boot controller
- Configuring memory options
- Selecting a language
- Launching other pre-boot environments such as the Embedded UEFI Shell and Intelligent Provisioning

For more information on the UEFI System Utilities, see the HPE UEFI System Utilities User Guide for HPE ProLiant Gen9 Servers on the Hewlett Packard Enterprise website (http://www.hpe.com/info/uefi/docs).

Scan the QR code located at the bottom of the screen to access mobile-ready online help for the UEFI System Utilities and UEFI Shell. For on-screen help, press F1.

Using UEFI System Utilities

To use the UEFI System Utilities, use the following keys.

<table>
<thead>
<tr>
<th>Action</th>
<th>Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access System Utilities</td>
<td>F9 during server POST</td>
</tr>
<tr>
<td>Navigate menus</td>
<td>Up and Down arrows</td>
</tr>
<tr>
<td>Select items</td>
<td>Enter</td>
</tr>
<tr>
<td>Save selections</td>
<td>F10</td>
</tr>
<tr>
<td>Access Help for a highlighted config option*</td>
<td>F1</td>
</tr>
</tbody>
</table>

*Scan the QR code on the screen to access online help for the UEFI System Utilities and UEFI Shell.

Default configuration settings are applied to the server at one of the following times:

- Upon the first system power-up
After defaults have been restored

Default configuration settings are sufficient for typical server operations; however, you can modify configuration settings as needed. The system prompts you for access to the UEFI System Utilities each time the system is powered up.

Flexible boot control

This feature enables you to do the following:

- **Add Boot Options**
  - Browse all FAT16 and FAT32 file systems.
  - Select an X64 UEFI application with an .EFI extension to add as a new UEFI boot option, such as an OS boot loader or other UEFI application.

  The new boot option is appended to the boot order list. When you select a file, you are prompted to enter the boot option description (which is then displayed in the Boot menu), as well as any optional data to be passed to an .EFI application.

- **Boot to System Utilities**
  After pre-POST, the boot options screen appears. During this time, you can access the UEFI System Utilities by pressing the F9 key.

- **Choose between supported modes: Legacy BIOS Boot Mode or UEFI Boot Mode**

  **IMPORTANT:** If the default boot mode settings are different than the user defined settings, the system may not boot the OS installation if the defaults are restored. To avoid this issue, use the User Defined Defaults feature in UEFI System Utilities to override the factory default settings.

For more information, see the HPE UEFI System Utilities User Guide for HPE ProLiant Gen9 Servers on the Hewlett Packard Enterprise website ([http://www.hpe.com/info/uefi/docs](http://www.hpe.com/info/uefi/docs)).

Restoring and customizing configuration settings

You can reset all configuration settings to the factory default settings, or you can restore system default configuration settings, which are used instead of the factory default settings.

You can also configure default settings as necessary, and then save the configuration as the custom default configuration. When the system loads the default settings, it uses the custom default settings instead of the factory defaults.

Secure Boot configuration

Secure Boot is integrated in the UEFI specification on which the Hewlett Packard Enterprise implementation of UEFI is based. Secure Boot is completely implemented in the BIOS and does not require special hardware. It ensures that each component launched during the boot process is digitally signed and that the signature is validated against a set of trusted certificates embedded in the UEFI BIOS. Secure Boot validates the software identity of the following components in the boot process:

- UEFI drivers loaded from PCIe cards
- UEFI drivers loaded from mass storage devices
- Pre-boot UEFI shell applications
- OS UEFI boot loaders

Once enabled, only firmware components and operating systems with boot loaders that have an appropriate digital signature can execute during the boot process. Only operating systems that support Secure Boot and have an EFI boot loader signed with one of the authorized keys can boot when Secure
Boot is enabled. For more information about supported operating systems, see the *HPE UEFI System Utilities and Shell Release Notes for HPE ProLiant Gen9 Servers* on the Hewlett Packard Enterprise website (http://www.hpe.com/info/uefi/docs).

A physically present user can customize the certificates embedded in the UEFI BIOS by adding/removing their own certificates.

When Secure Boot is enabled, the System Maintenance Switch does not restore all manufacturing defaults when set to the ON position. For security reasons, the following are not restored to defaults when the System Maintenance Switch is in the ON position:

- Secure Boot is not disabled and remains enabled.
- The Boot Mode remains in UEFI Boot Mode even if the default boot mode is Legacy Boot Mode.
- The Secure Boot Database is not restored to its default state.
- iSCSI Software Initiator configuration settings are not restored to defaults.

### Embedded UEFI shell

The system BIOS in all ProLiant Gen9 servers includes an Embedded UEFI Shell in the ROM. The UEFI Shell environment provides an API, a command line prompt, and a set of CLIs that allow scripting, file manipulation, and system information. These features enhance the capabilities of the UEFI System Utilities.

For more information, see the following documents:

- *UEFI Shell Specification* on the UEFI website (http://www.uefi.org/specifications)

### Embedded Diagnostics option

The system BIOS in all ProLiant Gen9 servers includes an Embedded Diagnostics option in the ROM. The Embedded Diagnostics option can run comprehensive diagnostics of the server hardware, including processors, memory, drives, and other server components.

For more information on the Embedded Diagnostics option, see the *HPE UEFI System Utilities User Guide for HPE ProLiant Gen9 Servers* on the Hewlett Packard Enterprise website (http://www.hpe.com/info/uefi/docs).

### iLO RESTful API support for UEFI

The ProLiant Gen9 servers include support for a UEFI compliant System BIOS, along with UEFI System Utilities and Embedded UEFI Shell pre-boot environments. ProLiant Gen9 servers also support configuring the UEFI BIOS settings using the ILO RESTful API, a management interface that server management tools can use to perform configuration, inventory, and monitoring of a ProLiant server. The ILO RESTful API uses basic HTTPS operations (GET, PUT, POST, DELETE, and PATCH) to submit or return JSON-formatted data with iLO web server.

For more information about the ILO RESTful API and the RESTful Interface Tool, see the Hewlett Packard Enterprise website (http://www.hpe.com/info/restfulinterface/docs).

### Re-entering the server serial number and product ID

After you replace the system board, you must re-enter the server serial number and the product ID.

1. During the server startup sequence, press the **F9** key to access UEFI System Utilities.
2. Select the **System Configuration > BIOS/Platform Configuration (RBSU) > Advanced Options > Advanced System ROM Options > Serial Number**, and then press the **Enter** key.

3. Enter the serial number and press the **Enter** key. The following message appears:
   
   The serial number should only be modified by qualified service personnel. This value should always match the serial number located on the chassis.

4. Press the **Enter** key to clear the warning.

5. Enter the serial number and press the **Enter** key.

6. Select **Product ID**. The following warning appears:

   Warning: The Product ID should ONLY be modified by qualified service personnel. This value should always match the Product ID located on the chassis.

7. Enter the product ID and press the **Enter** key.

8. Press the **F10** key to confirm exiting System Utilities. The server automatically reboots.

## Utilities and features

### HPE Smart Storage Administrator

The HPE SSA is a configuration and management tool for HPE Smart Array controllers. Starting with HPE ProLiant Gen8 servers, HPE SSA replaces ACU with an enhanced GUI and additional configuration features.

The HPE SSA exists in three interface formats: the HPE SSA GUI, the HPE SSA CLI, and HPE SSA Scripting. Although all formats provide support for configuration tasks, some of the advanced tasks are available in only one format.

Some HPE SSA features include the following:

- Supports online array capacity expansion, logical drive extension, assignment of online spares, and RAID or stripe size migration
- Provides diagnostic and SmartSSD Wear Gauge functionality on the Diagnostics tab
- For supported controllers, provides access to additional features.

For more information about HPE SSA, see the Hewlett Packard Enterprise website ([http://www.hpe.com/servers/ssa](http://www.hpe.com/servers/ssa)).

### Automatic Server Recovery

ASR is a feature that causes the system to restart when a catastrophic operating system error occurs, such as a blue screen, ABEND, or panic. A system fail-safe timer, the ASR timer, starts when the System Management driver, also known as the Health Driver, is loaded. When the operating system is functioning properly, the system periodically resets the timer. However, when the operating system fails, the timer expires and restarts the server.

ASR increases server availability by restarting the server within a specified time after a system hang. You can disable ASR from the System Management Homepage or through UEFI System Utilities.

### USB support

Hewlett Packard Enterprise servers support both USB 2.0 ports and USB 3.0 ports. Both types of ports support installing all types of USB devices (USB 1.0, USB 2.0, and USB 3.0), but may run at lower speeds in specific situations:

- USB 3.0 capable devices operate at USB 2.0 speeds when installed in a USB 2.0 port.
When the server is configured for UEFI Boot Mode, Hewlett Packard Enterprise provides legacy USB support in the pre-boot environment prior to the operating system loading for USB 1.0, USB 2.0, and USB 3.0 speeds.

When the server is configured for Legacy BIOS Boot Mode, Hewlett Packard Enterprise provides legacy USB support in the pre-boot environment prior to the operating system loading for USB 1.0 and USB 2.0 speeds. While USB 3.0 ports can be used with all devices in Legacy BIOS Boot Mode, they are not available at USB 3.0 speeds in the pre-boot environment. Standard USB support (USB support from within the operating system) is provided by the OS through the appropriate USB device drivers. Support for USB 3.0 varies by operating system.

For maximum compatibility of USB 3.0 devices with all operating systems, Hewlett Packard Enterprise provides a configuration setting for USB 3.0 Mode. Auto is the default setting. This setting impacts USB 3.0 devices when connected to USB 3.0 ports in the following manner:

- **Auto (default)**—If configured in Auto Mode, USB 3.0 capable devices operate at USB 2.0 speeds in the pre-boot environment and during boot. When a USB 3.0 capable OS USB driver loads, USB 3.0 devices transition to USB 3.0 speeds. This mode provides compatibility with operating systems that do not support USB 3.0 while still allowing USB 3.0 devices to operate at USB 3.0 speeds with state-of-the-art operating systems.

- **Enabled**—If Enabled, USB 3.0 capable devices operate at USB 3.0 speeds at all times (including the pre-boot environment) when in UEFI Boot Mode. This mode should not be used with operating systems that do not support USB 3.0. If operating in Legacy Boot BIOS Mode, the USB 3.0 ports cannot function in the pre-boot environment and are not bootable.

- **Disabled**—If configured for Disabled, USB 3.0 capable devices function at USB 2.0 speeds at all times.

The pre-OS behavior of the USB ports is configurable in the UEFI System Utilities, so that the user can change the default operation of the USB ports. For more information, see the **HPE UEFI System Utilities User Guide for HPE ProLiant Gen9 Servers** on the Hewlett Packard Enterprise website ([http://www.hpe.com/info/uefi/docs](http://www.hpe.com/info/uefi/docs)).

**External USB functionality**

Hewlett Packard Enterprise provides external USB support to enable local connection of USB devices for server administration, configuration, and diagnostic procedures.

For additional security, external USB functionality can be disabled through USB options in UEFI System Utilities.

**Redundant ROM support**

The server enables you to upgrade or configure the ROM safely with redundant ROM support. The server has a single ROM that acts as two separate ROM images. In the standard implementation, one side of the ROM contains the current ROM program version, while the other side of the ROM contains a backup version.

**NOTE:** The server ships with the same version programmed on each side of the ROM.

**Safety and security benefits**

When you flash the system ROM, the flashing mechanism writes over the backup ROM and saves the current ROM as a backup, enabling you to switch easily to the alternate ROM version if the new ROM becomes corrupted for any reason. This feature protects the existing ROM version, even if you experience a power failure while flashing the ROM.
Keeping the system current

Access to Hewlett Packard Enterprise Support Materials

Access to some updates for ProLiant Servers may require product entitlement when accessed through the Hewlett Packard Enterprise Support Center support portal. Hewlett Packard Enterprise recommends that you have an HP Passport set up with relevant entitlements. For more information, see the Hewlett Packard Enterprise website (http://www.hpe.com/support/AccessToSupportMaterials).

Updating firmware or System ROM

Multiple methods exist to update the firmware or System ROM:

- Service Pack for ProLiant (on page 122)
- FWUPDATE utility (on page 127)
- FWUpdate command from within the Embedded UEFI shell (on page 128)
- Firmware Update application in UEFI System Utilities ("Firmware Update application in the UEFI System Utilities" on page 128)
- Online Flash components (on page 128)

Product entitlement is required to perform updates. For more information, see "Accessing updates (on page 142)."

FWUPDATE utility

The FWUPDATE utility enables you to upgrade the system firmware (BIOS).

To use the utility to upgrade the firmware:

1. Download the FWUPDATE flash component from the Hewlett Packard Enterprise Support Center website (http://www.hpe.com/support/hpesc).
2. Save the FWUPDATE flash components to a USB key.
3. Set the boot order so the USB key will boot first using one of the following options:
   - Configure the boot order so the USB key is the first bootable device.
   - Press F11 (Boot Menu) when prompted during system boot to access the One-Time Boot Menu. This menu allows you to select the boot device for a specific boot and does not modify the boot order configuration settings.
4. Insert the USB key into an available USB port.
5. Boot the system.

The FWUPDATE utility checks the system and provides a choice (if more than one exists) of available firmware revisions.

To download the flash components, see the Hewlett Packard Enterprise Support Center website (http://www.hpe.com/support/hpesc).

For more information about the One-Time Boot Menu, see the HPE UEFI System Utilities User Guide for HPE ProLiant Gen9 Servers on the Hewlett Packard Enterprise website (http://www.hpe.com/info/uefi/docs).
FWUpdate command from within the Embedded UEFI Shell

For systems configured in either boot mode, update the firmware:

2. Copy the binary file to a USB media or iLO virtual media.
3. Attach the media to the server.
4. Boot to Embedded Shell.
5. To obtain the assigned file system volume for the USB key, enter Map -r. For more information about accessing a file system from the shell, see the HPE UEFI Shell User Guide for HPE ProLiant Gen9 Servers on the Hewlett Packard Enterprise website (http://www.hpe.com/info/uefi/docs).
6. Change to the file system that contains the System ROM Flash Binary component for your server. Enter one of the fsx file systems available, such as fs0 or fs1, and press Enter.
7. Use the cd command to change from the current directory to the directory that contains the binary file.
8. Enter fwupdate -d BIOS -f <filename> to flash the system ROM.
   For help on the FWUPDATE command, enter the command:
   help fwupdate -b
9. Reboot the server. A reboot is required after the firmware update for the updates to take effect and for hardware stability to be maintained.

For more information about the commands used in this procedure, see the HPE UEFI Shell User Guide for HPE ProLiant Gen9 Servers on the Hewlett Packard Enterprise website (http://www.hpe.com/info/uefi/docs).

Firmware Update application in the UEFI System Utilities

For systems configured in either boot mode, update the firmware:

1. Access the System ROM Flash Binary component for your server from the Hewlett Packard Enterprise Support Center website (http://www.hpe.com/support/hpesc). When searching for the component, always select OS Independent to find the component.
2. Copy the binary file to a USB media or iLO virtual media.
3. Attach the media to the server.
4. During POST, press F9 to enter System Utilities.
5. Select Embedded Applications → Firmware Update → System ROM → Select Firmware File.
6. Select the device containing the flash file.
7. Select the flash file. This step may take a few moments to complete.
8. Select Start firmware update and allow the process to complete.
9. Reboot the server. A reboot is required after the firmware update for the updates to take effect and for hardware stability to be maintained.

Online Flash components

This component provides updated system firmware that can be installed directly on supported operating systems. Additionally, when used in conjunction with the HP SUM, this Smart Component allows the user to update firmware on remote servers from a central location. This remote deployment capability eliminates the need for the user to be physically present at the server to perform a firmware update.

Drivers
IMPORTANT: Always perform a backup before installing or updating device drivers.

The server includes new hardware that may not have driver support on all OS installation media. If you are installing an Intelligent Provisioning-supported OS, use Intelligent Provisioning (on page 120) and its Configure and Install feature to install the OS and latest supported drivers.

If you do not use Intelligent Provisioning to install an OS, drivers for some of the new hardware are required. These drivers, as well as other option drivers, ROM images, and value-add software can be downloaded as part of an SPP.

If you are installing drivers from SPP, be sure that you are using the latest SPP version that your server supports. To verify that your server is using the latest supported version and for more information about SPP, see the Hewlett Packard Enterprise website (http://www.hpe.com/servers/spp/download).

To locate the drivers for a particular server, go to the Hewlett Packard Enterprise Support Center website (http://www.hpe.com/support/hpesc). Under Select your HPE product, enter the product name or number and click Go.

Software and firmware

Software and firmware should be updated before using the server for the first time, unless any installed software or components require an older version.

For system software and firmware updates, use one of the following sources:

- Download individual drivers, firmware, or other systems software components from the server product page in the Hewlett Packard Enterprise Support Center website (http://www.hpe.com/support/hpesc).

Operating System Version Support

For information about specific versions of a supported operating system, refer to the operating system support matrix (http://www.hpe.com/info/ossupport).

Version control

The VCRM and VCA are web-enabled Insight Management Agents tools that SIM uses to schedule software update tasks to the entire enterprise.

- VCRM manages the repository for SPP. Administrators can view the SPP contents or configure VCRM to automatically update the repository with internet downloads of the latest software and firmware from Hewlett Packard Enterprise.
- VCA compares installed software versions on the node with updates available in the VCRM managed repository. Administrators configure VCA to point to a repository managed by VCRM.

1. Select HP Insight Management from the available options in Products and Solutions.
2. Select HP Version Control from the available options in Insight Management.
3. Download the latest document.
Operating systems and virtualization software support for ProLiant servers

For information about specific versions of a supported operating system, see the Hewlett Packard Enterprise website (http://www.hpe.com/info/ossupport).

HPE Technology Service Portfolio

Connect to Hewlett Packard Enterprise for assistance on the journey to the new style of IT. The Hewlett Packard Enterprise Technology Services delivers confidence and reduces risk to help you realize agility and stability in your IT infrastructure.

Utilize our consulting expertise in the areas of private or hybrid cloud computing, big data and mobility requirements, improving data center infrastructure and better use of today’s server, storage and networking technology. For more information, see the Hewlett Packard Enterprise website (http://www.hpe.com/services/consulting).

Our support portfolio covers services for server, storage and networking hardware and software plus the leading industry standard operating systems. Let us work proactively with you to prevent problems. Our flexible choices of hardware and software support coverage windows and response times help resolve problems faster, reduce unplanned outages and free your staff for more important tasks. For more information, see the Hewlett Packard Enterprise website (http://www.hpe.com/services/support).

Tap into our knowledge, expertise, innovation and world-class services to achieve better results. Access and apply technology in new ways to optimize your operations and you’ll be positioned for success.

Change control and proactive notification

Hewlett Packard Enterprise offers Change Control and Proactive Notification to notify customers 30 to 60 days in advance of upcoming hardware and software changes on Hewlett Packard Enterprise commercial products.

For more information, see the Hewlett Packard Enterprise website (http://www.hpe.com/info/pcn).

Software and configuration utilities
Troubleshooting

Troubleshooting resources

The *HPE ProLiant Gen9 Troubleshooting Guide, Volume I: Troubleshooting* provides procedures for resolving common problems and comprehensive courses of action for fault isolation and identification, issue resolution, and software maintenance on ProLiant servers and server blades. To view the guide, select a language:

- English ([http://www.hpe.com/support/Gen9_TSG_en](http://www.hpe.com/support/Gen9_TSG_en))
- Spanish ([http://www.hpe.com/support/Gen9_TSG_es](http://www.hpe.com/support/Gen9_TSG_es))
- German ([http://www.hpe.com/support/Gen9_TSG_de](http://www.hpe.com/support/Gen9_TSG_de))
- Simplified Chinese ([http://www.hpe.com/support/Gen9_TSG_zh_cn](http://www.hpe.com/support/Gen9_TSG_zh_cn))

The *HPE ProLiant Gen9 Troubleshooting Guide, Volume II: Error Messages* provides a list of error messages and information to assist with interpreting and resolving error messages on ProLiant servers and server blades. To view the guide, select a language:

- German ([http://www.hpe.com/support/Gen9_EMG_de](http://www.hpe.com/support/Gen9_EMG_de))
Battery replacement

If the server no longer automatically displays the correct date and time, you may need to replace the battery that provides power to the real-time clock.

⚠️ **WARNING:** The computer contains an internal lithium manganese dioxide, a vanadium pentoxide, or an alkaline battery pack. A risk of fire and burns exists if the battery pack is not properly handled. To reduce the risk of personal injury:
- Do not attempt to recharge the battery.
- Do not expose the battery to temperatures higher than 60°C (140°F).
- Do not disassemble, crush, puncture, short external contacts, or dispose of in fire or water.
- Replace only with the spare designated for this product.

To remove the component:
1. Power down the server (on page 21).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Do one of the following:
   o Extend the server from the rack (on page 21).
   o Remove the server from the rack (on page 22).
4. Remove the access panel (on page 22).
5. If installed, remove the secondary PCIe riser cage ("Low-profile PCIe slot riser cage option" on page 71).
6. Locate the battery ("System board components" on page 14).
7. Remove the battery.

To replace the component, reverse the removal procedure.

For more information about battery replacement or proper disposal, contact an authorized reseller or an authorized service provider.

Обладнання відповідає вимогам Технічного регламенту щодо обмеження використання деяких небезпечних речовин в електричному та електронному обладнанні, затвердженого постановою Кабінету Міністрів України від 3 грудня 2008 № 1057
Electrostatic discharge

Preventing electrostatic discharge

To prevent damaging the system, be aware of the precautions you need to follow when setting up the system or handling parts. A discharge of static electricity from a finger or other conductor may damage system boards or other static-sensitive devices. This type of damage may reduce the life expectancy of the device.

To prevent electrostatic damage:

- Avoid hand contact by transporting and storing products in static-safe containers.
- Keep electrostatic-sensitive parts in their containers until they arrive at static-free workstations.
- Place parts on a grounded surface before removing them from their containers.
- Avoid touching pins, leads, or circuitry.
- Always be properly grounded when touching a static-sensitive component or assembly.

Grounding methods to prevent electrostatic discharge

Several methods are used for grounding. Use one or more of the following methods when handling or installing electrostatic-sensitive parts:

- Use a wrist strap connected by a ground cord to a grounded workstation or computer chassis. Wrist straps are flexible straps with a minimum of 1 megohm ±10 percent resistance in the ground cords. To provide proper ground, wear the strap snug against the skin.
- Use heel straps, toe straps, or boot straps at standing workstations. Wear the straps on both feet when standing on conductive floors or dissipating floor mats.
- Use conductive field service tools.
- Use a portable field service kit with a folding static-dissipating work mat.

If you do not have any of the suggested equipment for proper grounding, have an authorized reseller install the part.

For more information on static electricity or assistance with product installation, contact an authorized reseller.

</tr>
</tbody>
</table>

* All temperature ratings shown are for sea level. An altitude derating of 1.0°C per 304.8 m (1.8°F per 1000 ft) to 3048 m (10,000 ft) is applicable. No direct sunlight allowed. Maximum rate of change is 20°C per hour (36°F per hour). The upper limit and rate of change might be limited by the type and number of options installed.

For certain approved hardware configurations, the supported system inlet temperature range is extended:

- 5°C to 10°C (41°F to 50°F) and 35°C to 40°C (95°F to 104°F) at sea level with an altitude derating of 1.0°C per every 175 m (1.8°F per every 574 ft) above 900 m (2953 ft) to a maximum of 3048 m (10,000 ft).
- 40°C to 45°C (104°F to 113°F) at sea level with an altitude derating of 1.0°C per every 125 m (1.8°F per every 410 ft) above 900 m (2953 ft) to a maximum of 3048 m (10,000 ft).

The approved hardware configurations for this system are listed on the Hewlett Packard Enterprise website [http://www.hpe.com/servers/ASHRAE](http://www.hpe.com/servers/ASHRAE).

⚠️ WARNING: To reduce the risk of electric shock or energy hazards:
- This equipment must be installed by trained service personnel, as defined by the NEC and IEC 60950-1, Second Edition, the standard for Safety of Information Technology Equipment.
- Connect the equipment to a reliably grounded Secondary circuit source. A Secondary circuit has no direct connection to a Primary circuit and derives its power from a transformer, converter, or equivalent isolation device.
- The branch circuit overcurrent protection must be rated 27 A.

⚠️ CAUTION: This equipment is designed to permit the connection of the earthed conductor of the DC supply circuit to the earthing conductor at the equipment. If this connection is made, all of the following must be met:
- This equipment must be connected directly to the DC supply system earthing electrode conductor or to a bonding jumper from an earthing terminal bar or bus to which the DC supply system earthing electrode conductor is connected.
- This equipment must be located in the same immediate area (such as adjacent cabinets) as any other equipment that has a connection between the earthed conductor of the same DC supply circuit and the earthing conductor, and also the point of earthing of the DC system. The DC system must be earthed elsewhere.
- The DC supply source is to be located within the same premises as the equipment.
- Switching or disconnecting devices must not be in the earthed circuit conductor between the DC source and the point of connection of the earthing electrode conductor.

Hot-plug power supply calculations

For hot-plug power supply specifications and calculators to determine electrical and heat loading for the server, see the Hewlett Packard Enterprise Power Advisor website (http://www.hpe.com/info/poweradvisor/online).
Support and other resources

Accessing Hewlett Packard Enterprise Support

- For live assistance, go to the Contact Hewlett Packard Enterprise Worldwide website (http://www.hpe.com/assistance).
- To access documentation and support services, go to the Hewlett Packard Enterprise Support Center website (http://www.hpe.com/support/hpesc).

Information to collect

- Technical support registration number (if applicable)
- Product name, model or version, and serial number
- Operating system name and version
- Firmware version
- Error messages
- Product-specific reports and logs
- Add-on products or components
- Third-party products or components

Accessing updates

- Some software products provide a mechanism for accessing software updates through the product interface. Review your product documentation to identify the recommended software update method.
- To download product updates, go to either of the following:
  - Hewlett Packard Enterprise Support Center Get connected with updates page (http://www.hpe.com/support/e-updates)
  - Software Depot website (http://www.hpe.com/support/softwaredepot)

IMPORTANT: Access to some updates might require product entitlement when accessed through the Hewlett Packard Enterprise Support Center. You must have an HP Passport set up with relevant entitlements.

Websites

- Hewlett Packard Enterprise Information Library (http://www.hpe.com/info/enterprise/docs)
- Hewlett Packard Enterprise Support Center (http://www.hpe.com/support/hpesc)

Customer Self Repair

Hewlett Packard Enterprise products are designed with many Customer Self Repair (CSR) parts to minimize repair time and allow for greater flexibility in performing defective parts replacement. If during the diagnosis period Hewlett Packard Enterprise (or Hewlett Packard Enterprise service providers or service partners) identifies that the repair can be accomplished by the use of a CSR part, Hewlett Packard Enterprise will ship that part directly to you for replacement. There are two categories of CSR parts:

• **Mandatory**—Parts for which customer self repair is mandatory. If you request Hewlett Packard Enterprise to replace these parts, you will be charged for the travel and labor costs of this service.

• **Optional**—Parts for which customer self repair is optional. These parts are also designed for customer self repair. If, however, you require that Hewlett Packard Enterprise replace them for you, there may or may not be additional charges, depending on the type of warranty service designated for your product.

**NOTE:** Some Hewlett Packard Enterprise parts are not designed for customer self repair. In order to satisfy the customer warranty, Hewlett Packard Enterprise requires that an authorized service provider replace the part. These parts are identified as "No" in the Illustrated Parts Catalog.

Based on availability and where geography permits, CSR parts will be shipped for next business day delivery. Same day or four-hour delivery may be offered at an additional charge where geography permits. If assistance is required, you can call the Hewlett Packard Enterprise Support Center and a technician will help you over the telephone. Hewlett Packard Enterprise specifies in the materials shipped with a replacement CSR part whether a defective part must be returned to Hewlett Packard Enterprise. In cases where it is required to return the defective part to Hewlett Packard Enterprise, you must ship the defective part back to Hewlett Packard Enterprise within a defined period of time, normally five (5) business days. The defective part must be returned with the associated documentation in the provided shipping material. Failure to return the defective part may result in Hewlett Packard Enterprise billing you for the replacement. With a customer self repair, Hewlett Packard Enterprise will pay all shipping and part return costs and determine the courier/carrier to be used.

For more information about the Hewlett Packard Enterprise CSR program, contact your local service provider. For the North American program, go to the Hewlett Packard Enterprise CSR website ([http://www.hpe.com/support/selfrepair](http://www.hpe.com/support/selfrepair)).

Réparation par le client (CSR)

Les produits Hewlett Packard Enterprise comportent de nombreuses pièces CSR (Customer Self Repair = réparation par le client) afin de minimiser les délais de réparation et faciliter le remplacement des pièces défectueuses. Si pendant la période de diagnostic, Hewlett Packard Enterprise (ou ses partenaires ou mainteneurs agréés) détermine que la réparation peut être effectuée à l'aide d'une pièce CSR, Hewlett Packard Enterprise vous l'envoie directement. Il existe deux catégories de pièces CSR :
Riparazione da parte del cliente

Per abbreviare i tempi di riparazione e garantire una maggiore flessibilità nella sostituzione di parti difettose, i prodotti Hewlett Packard Enterprise sono realizzati con numerosi componenti che possono essere riparati direttamente dal cliente (CSR, Customer Self Repair). Se in fase di diagnostica Hewlett Packard Enterprise (o un centro di servizi o di assistenza Hewlett Packard Enterprise) identifica il guasto come riparabile mediante un ricambio CSR, Hewlett Packard Enterprise lo spedirà direttamente al cliente per la sostituzione. Vi sono due categorie di parti CSR:

- **Obbligatorie**—Parti che devono essere necessariamente riparate dal cliente. Se il cliente ne affida la riparazione ad Hewlett Packard Enterprise, deve sostenere le spese di spedizione e di manodopera per il servizio.

- **Opzionali**—Parti la cui riparazione da parte del cliente è facoltativa. Si tratta comunque di componenti progettati per questo scopo. Se tuttavia il cliente ne richiede la sostituzione ad Hewlett Packard Enterprise, potrebbe dover sostenere spese addizionali a seconda del tipo di garanzia previsto per il prodotto.

**NOTA:** alcuni componenti Hewlett Packard Enterprise non sono progettati per la riparazione da parte del cliente. Per rispettare la garanzia, Hewlett Packard Enterprise richiede che queste parti siano sostituite da un centro di assistenza autorizzato. Tali parti sono identificate da un "No" nel Catalogo illustrato dei componenti.

In base alla disponibilità e alla località geografica, le parti CSR vengono spedite con consegna entro il giorno lavorativo seguente. La consegna nel giorno stesso o entro quattro ore è offerta con un supplemento di costo solo in alcune zone. In caso di necessità si può richiedere l'assistenza telefonica di un addetto del centro di supporto tecnico Hewlett Packard Enterprise. Nel materiale fornito con una parte di ricambio CSR, Hewlett Packard Enterprise specifica se il cliente deve restituire dei componenti. Qualora sia richiesta la resa ad Hewlett Packard Enterprise del componente difettoso, lo si deve spedire ad Hewlett Packard Enterprise entro un determinato periodo di tempo, generalmente cinque (5) giorni lavorativi. Il componente difettoso deve essere restituito con la documentazione associata nell'imballo di
Customer Self Repair

Hewlett Packard Enterprise Produkte enthalten viele CSR-Teile (Customer Self Repair), um Reparaturzeiten zu minimieren und höhere Flexibilität beim Austausch defekter Bauteile zu ermöglichen. Wenn Hewlett Packard Enterprise (oder ein Hewlett Packard Enterprise Servicepartner) bei der Diagnose feststellt, dass das Produkt mithilfe eines CSR-Teils repariert werden kann, sendet Ihnen Hewlett Packard Enterprise dieses Bauteil zum Austausch direkt zu. CSR-Teile werden in zwei Kategorien unterteilt:

- **Zwingend**—Teile, für die das Customer Self Repair-Verfahren zwingend vorgegeben ist. Wenn Sie den Austausch dieser Teile von Hewlett Packard Enterprise vornehmen lassen, werden Ihnen die Anfahrt- und Arbeitskosten für diesen Service berechnet.

Reparaciones del propio cliente

Los productos de Hewlett Packard Enterprise incluyen muchos componentes que el propio usuario puede reemplazar (Customer Self Repair, CSR) para minimizar el tiempo de reparación y ofrecer una mayor flexibilidad a la hora de realizar sustituciones de componentes defectuosos. Si, durante la fase de diagnóstico, Hewlett Packard Enterprise (o los proveedores o socios de servicio de Hewlett Packard Enterprise) identifica que una reparación puede llevarse a cabo mediante el uso de un componente CSR, Hewlett Packard Enterprise le enviará dicho componente directamente para que realice su sustitución. Los componentes CSR se clasifican en dos categorías:
• **Obligatorio**—componentes cuya reparación por parte del usuario es obligatoria. Si solicita a Hewlett Packard Enterprise que realice la sustitución de estos componentes, tendrá que hacerse cargo de los gastos de desplazamiento y de mano de obra de dicho servicio.

• **Opcional**—componentes cuya reparación por parte del usuario es opcional. Estos componentes también están diseñados para que puedan ser reparados por el usuario. Sin embargo, si precisa que Hewlett Packard Enterprise realice su sustitución, puede o no conllevar costes adicionales, dependiendo del tipo de servicio de garantía correspondiente al producto.

**NOTA:** Algunos componentes de Hewlett Packard Enterprise no están diseñados para que puedan ser reparados por el usuario. Para que el usuario haga valer su garantía, Hewlett Packard Enterprise pone como condición que un proveedor de servicios autorizado realice la sustitución de estos componentes. Dichos componentes se identifican con la palabra "No" en el catálogo ilustrado de componentes.

Según la disponibilidad y la situación geográfica, los componentes CSR se enviarán para que lleguen a su destino al siguiente día laborable. Si la situación geográfica lo permite, se puede solicitar la entrega en el mismo día o en cuatro horas con un coste adicional. Si precisa asistencia técnica, puede llamar al Centro de asistencia técnica de Hewlett Packard Enterprise y recibirá ayuda telefónica por parte de un técnico. Con el envío de materiales para la sustitución de componentes CSR, Hewlett Packard Enterprise especificará si los componentes defectuosos deberán devolverse a Hewlett Packard Enterprise. En aquellos casos en los que sea necesario devolver algún componente a Hewlett Packard Enterprise, deberá hacerlo en el periodo de tiempo especificado, normalmente cinco días laborables. Los componentes defectuosos deberán devolverse con toda la documentación relacionada y con el embalaje de envío. Si no envíe el componente defectuoso requerido, Hewlett Packard Enterprise podrá cobrarle por el de sustitución. En el caso de todas las sustituciones que lleve a cabo el cliente, Hewlett Packard Enterprise se hará cargo de todos los gastos de envío y devolución de componentes y escogerá la empresa de transporte que se utilice para dicho servicio.

Para obtener más información acerca del programa de Reparaciones del propio cliente de Hewlett Packard Enterprise, póngase en contacto con su proveedor de servicios local. Si está interesado en el programa para Norteamérica, visite la página web de Hewlett Packard Enterprise CSR ([http://www.hpe.com/support/selfrepair](http://www.hpe.com/support/selfrepair)).

### Customer Self Repair

Veel onderdelen in Hewlett Packard Enterprise producten zijn door de klant zelf te repareren, waardoor de reparatietermijn tot een minimum beperkt kan blijven en de flexibiliteit in het vervangen van defecte onderdelen groter is. Deze onderdelen worden CSR-onderdelen (Customer Self Repair) genoemd. Als Hewlett Packard Enterprise (of een Hewlett Packard Enterprise Service Partner) bij de diagnose vaststelt dat de reparatie kan worden uitgevoerd met een CSR-onderdeel, verzendt Hewlett Packard Enterprise dat onderdeel rechtstreeks naar u, zodat u het defecte onderdeel daarmee kunt vervangen. Er zijn twee categorieën CSR-onderdelen:

- **Verplicht**—Onderdelen waarvoor reparatie door de klant verplicht is. Als u Hewlett Packard Enterprise verzoekt deze onderdelen voor u te vervangen, worden u voor deze service reiskosten en arbeidsloon in rekening gebracht.

- **Optioneel**—Onderdelen waarvoor reparatie door de klant optioneel is. Ook deze onderdelen zijn ontworpen voor reparatie door de klant. Als u echter Hewlett Packard Enterprise verzoekt deze onderdelen voor u te vervangen, kunnen daarvoor extra kosten in rekening worden gebracht, afhankelijk van het type garantiservice voor het product.

**OPMERKING:** Sommige Hewlett Packard Enterprise onderdelen zijn niet ontwikkeld voor reparatie door de klant. In verband met de garantievoorwaarden moet het onderdeel door een geautoriseerde Service Partner worden vervangen. Deze onderdelen worden in de geïllustreerde onderdelencatalogus aangemerkt met "Nee".

Afhankelijk van de leverbaarheid en de locatie worden CSR-onderdelen verzonden voor levering op de eerstvolgende werkdag. Levering op dezelfde dag of binnen vier uur kan tegen meerkosten worden aangeboden, indien dit mogelijk is gezien de locatie. Indien assistentie is gewenst, belt u het Hewlett Packard Enterprise Support Center om via de telefoon ondersteuning van een technicus te ontvangen.

Neem contact op met een Service Partner voor meer informatie over het Customer Self Repair programma van Hewlett Packard Enterprise. Informatie over Service Partners vindt u op de Hewlett Packard Enterprise website (http://www.hpe.com/support/selfrepair).

Reparo feito pelo cliente

Os produtos da Hewlett Packard Enterprise são projetados com muitas peças para reparo feito pelo cliente (CSR) de modo a minimizar o tempo de reparo e permitir maior flexibilidade na substituição de peças com defeito. Se, durante o período de diagnóstico, a Hewlett Packard Enterprise (ou fornecedores/parceiros da Hewlett Packard Enterprise) concluir que o reparo pode ser efetuado pelo uso de uma peça CSR, a Hewlett Packard Enterprise enviará a peça diretamente ao cliente. Há duas categorias de peças CSR:

- **Obrigatória**—Peças cujo reparo feito pelo cliente é obrigatório. Se desejar que a Hewlett Packard Enterprise substitua essas peças, serão cobradas as despesas de transporte e mão-de-obra do serviço.

- **Opcional**—Peças cujo reparo feito pelo cliente é opcional. Essas peças também são projetadas para o reparo feito pelo cliente. No entanto, se desejar que a Hewlett Packard Enterprise as substitua, pode haver ou não a cobrança de taxa adicional, dependendo do tipo de serviço de garantia destinado ao produto.

**OBSERVAÇÃO:** Algumas peças da Hewlett Packard Enterprise não são projetadas para o reparo feito pelo cliente. A fim de cumprir a garantia do cliente, a Hewlett Packard Enterprise exige que um técnico autorizado substitua a peça. Essas peças estão identificadas com a marca "No" (Não), no catálogo de peças ilustrado.

Conforme a disponibilidade e o local geográfico, as peças CSR serão enviadas no primeiro dia útil após o pedido. Onde as condições geográficas permitirem, a entrega no mesmo dia ou em quatro horas pode ser feita mediante uma taxa adicional. Se precisar de auxílio, entre em contato com o Centro de suporte técnico da Hewlett Packard Enterprise para que um técnico o ajude por telefone. A Hewlett Packard Enterprise especifica nos materiais fornecidos com a peça CSR de reposição se a peça com defeito deve ser devolvida à Hewlett Packard Enterprise. Nos casos em que isso for necessário, é preciso enviar a peça com defeito à Hewlett Packard Enterprise, você deverá enviar a peça com defeito de volta para a Hewlett Packard Enterprise dentro do período de tempo definido, normalmente em 5 (cinco) dias úteis. A peça com defeito deve ser enviada com a documentação correspondente no material de transporte fornecido. Caso não o faça, a Hewlett Packard Enterprise poderá cobrar a reposição. Para as peças de reparo feito pelo cliente, a Hewlett Packard Enterprise paga todas as despesas de transporte e de devolução da peça e determina a transportadora/serviço postal a ser utilizado.

カスタマーサービスリペア

修理時間を短縮し、故障部品の交換における高い柔軟性を確保するために、Hewlett Packard Enterprise製品には多数のカスタマーサービスリペア（CSR）部品があります。診断の際に、CSR部品を使用すれば修理ができるとHewlett Packard Enterprise（Hewlett Packard EnterpriseまたはHewlett Packard Enterprise正規保守代理店）が判断した場合、Hewlett Packard Enterpriseはその部品を直接、お客様に発送し、お客様に交換していただきます。CSR部品には以下の2種類があります。

- 必須 - カスタマーサービスリペアが必須の部品。当該部品について、もしもお客様がHewlett Packard Enterpriseに交換作業を依頼される場合には、その修理サービスに関する交通費および人件費がお客様に請求されます。
- 任意 - カスタマーサービスリペアが任意である部品。この部品もカスタマーサービスリペア用です。当該部品について、もしもお客様がHewlett Packard Enterpriseに交換作業を依頼される場合には、お買い物の製品に適用される保証サービス内容の範囲内においては、別途費用を負担していただくことなく保証サービスを受けることができます。

注：Hewlett Packard Enterprise製品の一部の部品は、カスタマーサービスリペアの対象外です。製品の保証を継続するためには、Hewlett Packard EnterpriseまたはHewlett Packard Enterprise正規保守代理店による交換作業が必要となります。部品カタログには、当該部品がカスタマーサービスリペア除外品である旨が記載されています。

部品供給が可能な場合、地域によっては、CSR部品を翌営業日に届くように発送します。また、地域によっては、追加費用を負担いただくことにより同日または4時間以内に届くように発送することも可能な場合があります。サポートが必要なときは、Hewlett Packard Enterpriseの修理受付窓口に電話していただければ、技術者が電話でアドバイスします。交換用のCSR部品または同様物には、故障部品をHewlett Packard Enterpriseに返送する必要があるかどうかが表示されています。故障部品をHewlett Packard Enterpriseに返送する必要がある場合は、指定期限内（通常は5営業日以内）に故障部品をHewlett Packard Enterpriseに返送してください。故障部品を返送する場合は、届いた時の梱包箱に関連書類とともに入れてください。故障部品を返送しない場合、Hewlett Packard Enterpriseから部品費用が請求されます。カスタマーサービスリペアの際には、Hewlett Packard Enterpriseは送料および部品返送費を全額負担し、使用する宅配便会社や運送会社を指定します。
客戶自行維修

Hewlett Packard Enterprise 提供許多客戶自行維修 (CSR) 部件，以盡可能縮短維修時間和在
換缺件時所提供的必要工具。如果在診斷期間 Hewlett Packard Enterprise （或 Hewlett
Packard Enterprise 服務供應商或服務合作夥伴）確定可以透過使用 CSR 部件完成維修，Hewlett
Packard Enterprise 將直接把該部件發送给您進行維修。有兩類 CSR 部件：

- 強制性的 — 要求客戶必須自行維修的部件。如果您要求 Hewlett Packard Enterprise 更換這些部件，
  則必須為該部件支付差旅費和人工費用。
- 可選的 — 客戶可以選擇是否自行維修的部件。這些部件也是為客戶自行維修設計的。不過，如
  果您要求 Hewlett Packard Enterprise 为您更换这些部件，则根据为您的产品指定的保修服务类
  型，Hewlett Packard Enterprise 可能收取或不再收取任何附加费用。

注：某些 Hewlett Packard Enterprise 部件的设计并未考虑客户自行维修。为了满足客户保修的需要，
Hewlett Packard Enterprise 要求授权服务提供商更换相关部件。这些部件在部件图解目录中标记为
“否”。

CSR 部件将在下一个工作日发运（取决于备货情况和允许的地理范围）。在允许的地理范围内，可在
当天或次日发运，但要收取额外费用。如果需要帮助，您可以致電 Hewlett Packard Enterprise
技术支持中心，將會有技術人員通過電話為您提供幫助。Hewlett Packard Enterprise 会在更换的
CSR 部件发送的材料中指明是否必须将有缺陷的部件返给 Hewlett Packard Enterprise。如果要求您
将有缺陷的部件返还给 Hewlett Packard Enterprise，那么您必须在规定的期限内（通常是五 (5) 个工作
日）将缺陷部件发给 Hewlett Packard Enterprise。有缺陷的部件的最终提供的发运材料中将有关
件文件一起返还。如果未能送还有关件的部件，Hewlett Packard Enterprise 可能会要求您支付更換費用。

客戶自行維修

Hewlett Packard Enterprise 產品設計了許多「客戶自行維修」(CSR) 的零件以減少維修時間，並且
使得更換底件時能有更大的彈性。如果在診斷期間，Hewlett Packard Enterprise (或 Hewlett
Packard Enterprise 服務供應商或維修夥伴) 辨認出此項維修工作可以藉由使用 CSR 零件來完成，
則 Hewlett Packard Enterprise 將直接寄送該零件給您作更換。CSR 零件分成兩種類別：

- 強制的 — 客戶自行維修所使用的零件是強制性的，如果您要求 Hewlett Packard Enterprise 更換
  這些零件，Hewlett Packard Enterprise 將會向您收取此服務所需的外出費用和勞動成本。
- 選購的 — 客戶自行維修所使用的零件是選購的。這些零件也設計用於客戶自行維修之用。不過，
  如果您要求 Hewlett Packard Enterprise 為您更換，則可能需要您可能不需要負擔額外的費用，端視
  針對此產品指定的保固服務類型而定。

備註：某些 Hewlett Packard Enterprise 零件沒有消費者可以自行維修的設計。為符合客戶保固，Hewlett
Packard Enterprise 需要授權的服務供應商更換零件。這些零件在圖示的零件目錄中，有標示為「否」。

基於材料取得及環境允許的情況下，CSR 零件將於下一個工作日以快速寄送。在環境的允許下當天或四
小時內送達，則可能需要額外的費用。若您需要援助，可致電 Hewlett Packard Enterprise 支援中心，會
有一位技術人員透過電話來協助您。不論損壞的零件是否必須退回，Hewlett Packard Enterprise 會在與
CSR 替換零件一起隨送的材料中註明。若要將損壞的零件退回 Hewlett Packard Enterprise，您必須在指
定的一段時間內（通常是五 (5) 個工作天）將損壞的零件寄回 Hewlett Packard Enterprise。損壞的零件必
須與寄送資料中隨附的相關資訊文件一併退還。如果無法退還損壞的零件，Hewlett Packard Enterprise 可
能會向您收取替換費用。針對客戶自行維修情形，Hewlett Packard Enterprise 將負責所有運費及零件運費
費用，並指定使用何家快速/貨運公司。

如需 Hewlett Packard Enterprise 的 CSR 運送詳細資訊，請聯絡您當地的服務供應商。關於北美地區，
請參閱 Hewlett Packard Enterprise 的 CSR 網站 repair (http://www.hpe.com/support/selfrepair)。

Support and other resources  149
Remote support

Remote support is available with supported devices as part of your warranty or contractual support agreement. It provides intelligent event diagnosis, and automatic, secure submission of hardware event notifications to Hewlett Packard Enterprise, which will initiate a fast and accurate resolution based on your product’s service level. Hewlett Packard Enterprise strongly recommends that you register your device for remote support.

For more information and device support details, go to the Insight Remote Support website (http://www.hpe.com/info/insightremotesupport/docs).
